GENERAL  **ELECTRIC**

These instructions do not purport to cover all details or variations in equipment nor to provide for every possible contingency to be met in connection with installation, operation or maintenance. Should further information be desired or should particular problems arise which are not covered sufficiently for the purchaser's purposes, the matter should be referred to the General Electric Company.

TABLE OF CONTENTS

MOTHER BOARD CONNECTIONS AND SIGNAL NAME DEFINITIONS FOR "B" AND "C" MODEL PRINTERS

| | | |

MOTHER BOARD CONNECTIONS AND SIGNAL NAME DEFINITIONS FOR "B" AND "C" MODEL PRINTERS

DESCRIPTION OF CONNECTION LISTS

The following tabulated information is a list of TermiNet Mother Board runs and various signals using the runs.

The first column has a maximum of six characters and is used for signal identification. A hyphen at the end of the signal name designates a barred signal. Conversely, no hyphen means that the signal is not barred.

The second column can have a maximum of three characters, R or S, C, and B. The R stands for receive and designates that the location is a signal sink. The S stands for source and designates that the location acts as a signal source. The C stands for cable and means that there is a cable connection at that point. The B stands for board and means that the signal is brought into the board at that location.

The third column has a maximum of six characters and designates which board or plug is located in a particular slot in the bustle rack.

The fourth column gives the exact signal location. The first two digits identify the slot number, the letter identifies the connector, and the last two digits give the pin number.

The fifth column contains information used by the factory.

The sixth and last column gives the group and revision number of the Mother Board to which the listed signal applies.

In the case of the SPC, T.A, and DAT boards, one can differentiate whether the signal is used by the standard or Dow Jones Printer, or both by the third column. The regular abbreviation, SPC, T.A, or DAT, designates that the signal is used by standard Printers only. The board abbreviation with a D on the end, SPCD, T.AD, or DATD, designates that the

signal is used by Dow Jones Printers only. However, the board abbreviation with a /D on the end, SPC/D, T.A/D, or DAT/D, means that the signal is used by both standard and Dow Jones Printers.

ACA stands for auxiliary cable. This cable connects the AUX board with the equipment being interfaced with the TermiNet Printer. The cable is connected to the back of the AUX board and passes through the bustle cover to the outside equipment. There are no Mother Board runs. This is an external cable connected directly to the AUX board. The ACA has been entered in this list along with DSPLG, PCHPLG, and RDRPLG to help keep track of signals going to external equipment.

It should be noted that ACA, DSPLG, PCHPLG, and RDRPLG have been assigned dummy slots merely to facilitate sorting of computer cards for this printout.

Several boards are not used in the Dow Jones Printers. These are the KIF, R.P, PSC, ANS, AUX, and PPI. In addition, the line termination unit (LTU) is used in the Dow Jones Printer in the standard PSC slot. However, this board has only two connections, A10 and A11. These pins are connected, respectively, to MOD A03 and A04 by means of wire-wrapping a pair of twisted leads to the connector pins at those two slots. This connection is found on the Dow Jones Printer only.

Sheets 2 through 39 of 44A410433 pertain to the "B" Model Printer.

The signal definitions on sheets 40 through 48 of 44A410433 pertain to the "B" Model Printer and, in most cases, to the "C" Model Printer.

Sheets 2 through 39 of 44A410753 pertain to the "C" Model Printer.

CONNECTOR CROSS REFERENCE

Starting approximately January 1972, some of the Burndy type connectors used in the TermiNet 300 Printer Desk Console, and TermiNet Cassette Accessory were replaced by the AMP* type connector. The Burndy type connector is green in color and uses numeric characters only to identify the connection. The AMP type connector is brown in color and uses alpha and numeric characters to identify the connections. Because all of the drawings involved are

not changed, and earlier TermiNet products will still have the Burndy type connector, the following cross reference table should be used when:

1. A drawing reflecting the AMP type connector is used to troubleshoot a TermiNet product with the Burndy type connector.
2. A drawing reflecting the Burndy type connector is used to troubleshoot a TermiNet product with the AMP type connector.

CONNECTOR CROSS REFERENCE TABLE

SH. NO. 40

| | |
|------------------|---|
| 0V | Signal Ground. |
| 120 CPS | Full Wave 60 Hz Used to Generate TL Signals. 120 Hz Pulse Generated from Full Wave 60 Hz. |
| <u>1 SET</u> | PPI Reset. |
| 1TL thru 8TL | Tens Position for PPI Lamp. |
| <u>536 MS</u> | 536 Millisecond Clock. |
| <u>600</u> | 600 Baud Select. |
| 63A | Serial Character Bit Data Stored in Memory. One Bit Upstream from 64A. |
| 64A | Serial Character Bit Data Stored in Memory. |
| 63B | Serial Position Bit Data Stored in Memory. One Bit Upstream from 64B. |
| 64B | Serial Position Bit Data Stored in Memory. |
| 672 KHZ | Crystal Master Clock. |
| <u>67 MS</u> | 67 MS Clock. |
| 75H | 75/118 Line Length Selector. |
| /15V | Regulated /15 Volt D.C. Supply. |
| /16V | Positive Full Wave Supply. |
| /20V | Unregulated /20V D.C. Supply. |
| /2.3V | Regulated /2.3 V D.C. Supply. |
| /3V | Regulated /3V D.C. Supply. |
| /P | Positive Power Supplied by and Used by Telephone Company Equipment Only. |
| A1 - A8 | Character Data Bits in Parallel Form from SPC Board. |
| AACKR | Auxiliary ACK Received. |
| AA | Protective (Frame) Ground. |
| ABOPT | Answerback Option is in. |
| ACKR | ACK Received. |
| ADV | Advance Punch Tape. |
| <u>A11 - A18</u> | Auxiliary Parallel Input Data |
| AINH | Auxiliary Inhibit Print. |
