- Terms highlighted in bold-faced italics (such as ***example***) are specific to RT PC and are included in the glossary. Terms highlighted in bold type (such as **example**) are specific keys on the keyboard. Terms or phrases that appear in monospace type (such as `example`) are examples you might see on a display screen or what you must enter into the system to perform a given function.

## Code Page Overview

The IBM RT PC has 571 distinct characters.

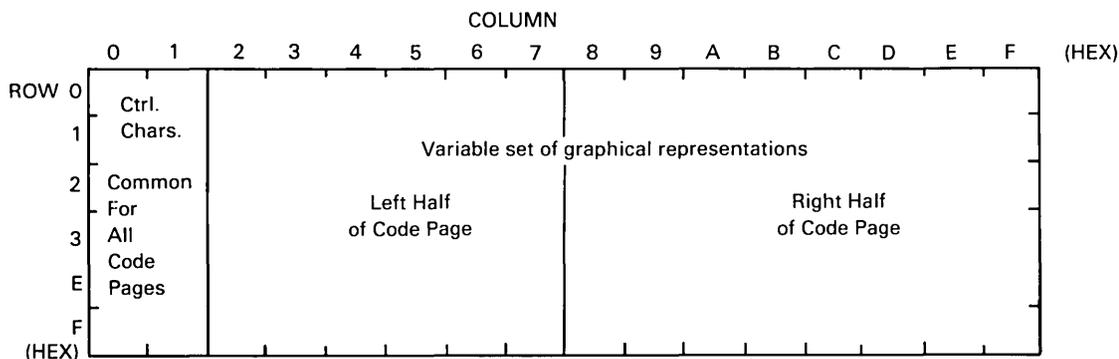

To designate these characters within the RT PC, a code page format has been established. Each code page consists of 256 possible graphic representations. The first 32 code points in each code page are reserved for control characters and are common for all code pages. The control code points do not have graphic representations.

The remaining 539 characters are divided into three code pages:

- Code Page P0
- Code Page P1
- Code Page P2.

Each code page can have a maximum of 224 graphic characters.

The general code page layout is shown below.

The following figures, Figure 1-1 on page 1-5, Figure 1-2 on page 1-6, and Figure 1-3 on page 1-7, summarize the layout of Code Pages P0, P1, and P2, respectively.

The descriptions of characters in Code Pages P0, P1, and P2 are given in Figure 1-4 on page 1-11, Figure 1-5 on page 1-18, and in Figure 1-6 on page 1-25, respectively.

## Code Page Switching

Four of the control characters in the previous code pages are defined as (*SSn*) *single shift* characters, namely, SS1, SS2, SS3, and SS4. Using one of these characters in an input or output data stream means that the character following the single shift control is from:

- Code Page P1 left half (0x20 – 0x7f)
- Code Page P1 right half (0x80 – 0xff)
- Code Page P2 left half (0x20 – 0x7f)
- Code Page P2 right half (0x80 – 0xff).

Code points from Code Page P0 are not preceded by a single shift control character. The advantages of this code page switching scheme are that existing 7-bit and 8-bit ASCII programs can operate together with programs developed to use the full RT PC character set and, as the most used characters are in Code Page P0, the number of additional shift characters is limited.

An example of a data stream used is:

P0, P0, P0, P0, P0, P0, P0, SS3, P2, P0, P0, SS1, P1, P0, P0 . . .

Where: P0 is a character from Code Page P0

P1 is a character from Code Page P1

P2 is a character from Code Page P2

SS1 and SS3 are the single shift control characters

RT PC applications can be divided into three categories regarding their level of usage. Applications from all categories can run concurrently on the system.

The first category is the 7-bit US ASCII in RT PC represented by code points 32 (0x20) to 127 (0x7f) in Code Page P0, the left half of Code Page P0.

The second category is for all characters in Code Page P0 which are in code points 32 (0x20) to 255 (0xff).

The third and most extended category is where all code pages in RT PC can be addressed.

The level of international characters you use will be determined by the level of the input devices, the operating system, the application programs, and the output devices.

---

## Code Point Processing

The code point encoding scheme can be illustrated by the following example in which bit patterns are represented and SS1, SS2, SS3, and SS4 are the single byte controls, Single Shift 1, 2, 3, and 4:

0xxx	xxxx	Left half of P0	
1xxx	xxxx	Right half of P0	
SS1	1xxx	xxxx	Left half of P1
SS2	1xxx	xxxx	Right half of P1
SS3	1xxx	xxxx	Left half of P2
SS4	1xxx	xxxx	Right half of P2

In this scheme, code points in the range of 0x00 – 0x7f are unique in the data stream.<sup>1</sup> If echo<sup>00</sup> is on, these code points are never validly preceded by a single shift control byte. Only code points in the range of 0x80 – 0xff are legitimately allowed to be preceded by a single shift control. Code points in the range of 0x80 – 0xff are also valid when they are not preceded by a single shift control.

The advantages of this encoding scheme are realized in virtual machine operating systems, applications, and utilities which are traditionally 7-bit ASCII oriented. These advantages are:

- Reduction of the amount of change to most programs
- Elimination of changes to many programs
- Reduction of changes to the virtual machine operating system

When data is entered using the keyboard, the VTMP prefixes code points for characters which are in the left half of Code Page P1, the right half of Code Page P1, the left half of Code Page P2, or the right half of Code Page P2 with SS1, SS2, SS3, or SS4, respectively, and performs the appropriate encoding. Code points for characters in Code Page P0 are unprefixed.

---

<sup>1</sup> If echo is off, the terminal will not set the high-order bit. In this case, if you enter a single shift control followed by a code point (range 0x00 – 0x7f), the data stream will be reported as keyed. That is, the high-order bit will not be set. Note that the state of echo has no effect on the data stream reported for single keys. A single key that is assigned a code point in a Code Page 1 or Code Page 2 will always be reported according to the above scheme. For example, a key assigned a code point of 0x41 in Code Page 2 will always be reported in the data stream as 0x1dc1.

---

## P0, P1, and P2 Character Graphic Code Points

The arrangement of the 571 characters into the three code pages, P0, P1, and P2 is shown in the following pages. The table that follows gives you an explanation of each column and heading in the tables.

<b>Position Number</b>	Number of the character.
<b>Character</b>	Shows that actual character along with a brief description of the character.
<b>Code Page</b>	The hexadecimal (column, row) representation within the code page.
<b>Internal Code</b>	The internal data stream representation of the character.

The characters in Code Page P0, indicated by the prefix *P0* to the left of their hexadecimal notation, have an internal (data stream) representation of the unprefix code point. For example, the Code Page P0 character *Ñ (n Tilde Capital)* has an internal representation of 0xa5.

The characters which are in Code Page P1, indicated by the prefix *P1* to the left of their hexadecimal code page index, have an internal representation of SS1 or SS2 preceding the code point for characters in the left half or right half, respectively. The characters in Code Page P2, indicated by the prefix *P2* to the left of their hexadecimal code page index, have an internal representation of SS3 or SS4 preceding the code point for characters in the left half or right half, respectively. For example, the Code Page P1 character, *Ã (a Tilde Capital)*, has an internal representation of 0x1fc5 and the Code Page P2 character *≠ (Not Equal Sign)* has an internal representation of 0x1da3.

A display used by the Coprocessor may not show the characters you expect to see for the following reasons:

- The characters used by the program running on the Coprocessor are not available with that particular display. You may see blanks or substitute characters instead.
- The characters used by the program running on the Coprocessor may not be available to the Coprocessor itself.

Characters that are not available to the Coprocessor itself are translated into RT PC characters. See the following table for a list of these characters.

## Keyboard Overview

The following keyboards are available on the RT PC:

- Belgian-French/Dutch
- Canadian-French
- Danish
- Finnish/Swedish
- French
- German
- Italian
- Japanese
- Norwegian
- Portuguese
- Spanish
- Swiss-French/German
- UK English
- US English

With the exception of the US English keyboard and the Japanese keyboard, all keyboards have 102 keys. The US English keyboard has 101 keys, and the Japanese keyboard has 106 keys. The differences in the keyboards occur because each country requires a specific set of graphic characters (*character set*) for the native language as well as a specific keyboard layout (*graphic key arrangement*) on the keyboard.

Keyboard tables are shipped with the Virtual Resource Manager (VRM), and a keyboard table is installed during VRM installation. The US English keyboard mapping is the default keyboard mapping until a different keyboard, such as the German keyboard, is installed. Refer to *IBM RT PC Installing and Customizing the AIX Operating System* for the procedure to install the keyboard specific to your country.

The keyboard position code layouts are given in the following section.

---

## Keyboard Position Codes

The figures on the following pages give the key position codes for each of the three keyboards.

## Keyboard States

Each key on the keyboard has five potential states:

- Base
- Shift
- Ctrl (control)
- Alt (alternate)
- AltGr (alternate graphic).

For the US 101-key keyboard, the AltGr state is identical to the Alt state; therefore, this keyboard gives the appearance of having only four states (Base, Shift, Ctrl, and Alt). In addition, some of these keys are also governed by the **Caps Lock** key or the **Shift Lock** key.

For those keyboards that support **Caps Lock**, **Caps Lock** affects only those keys whose Shift state yields the uppercase character (A, B, C . . . ) of the Base state lower case character (a, b, c . . . ) of the key. For those keyboards that support **Shift Lock**, **Shift Lock** has the same affect as pressing a key while the **Shift** key is pressed.

The Japanese keyboard does not have an **AltGr** key; only the right **Alt** key is available. This keyboard has four states: Base, Shift, Control, and Alt.

Refer to Appendix B, “Differences Between the 101-, 102-, and 106-Key Keyboards” on page B-1 for specific differences in the physical keyboard arrangements. Also, the illustrations and tables in Appendix D, “Belgian-French/Dutch Keyboard Layout and Table” on page D-1 through Appendix R, “US English Keyboard Layout and Table” on page R-1 give you details of the keyboard layouts, and tables containing such information as key character assignments, the keyboard definition for each key state, the effect of the **Caps Lock** key, and so on.

## Overview of Nonspacing Characters

Among the 571 graphic characters available in RT PC, 13 diacritics are used to construct diacritical (accented) characters. The constructed diacritical characters yield a set of characters over and above those engraved on any specific country-dependent keyboard.

A *nonspacing character sequence* is defined as a two-key sequence consisting of one of the thirteen diacritics followed by an alphabetic character.

### Valid Nonspacing Character Sequences

Valid nonspacing character sequences are restricted to combinations of diacritical characters and alphabetic characters listed in “Accented Characters” on page 1-41. When the Virtual Terminal Mode Processor is running in translate mode, valid nonspacing character sequences are always folded into a single character within a code page among P0, P1, or P2 prior to passing the keyboard input to the application.

A special case exists when the nonspacing character sequence consists of a diacritic followed by a space. In this case, the diacritic character itself is displayed or sent to the application.

### Invalid Nonspacing Character Sequences

If the nonspacing character sequence is invalid (does not conform to the description given for valid nonspacing character sequences) the VTMP passes the *nonspacing character* to the application followed by the second character of the sequence. Invalid nonspacing character sequences include sequences which:

- Start with a nonspacing character but are followed by an alphabetic character such that the resulting diacritical character does not exist in the system,  
or
- Start with a nonspacing character but are followed by a non-alphabetic character (numeric, control, function key),  
or
- Start with a nonspacing character but are followed by another nonspacing character.

---

## Suspended Nonspacing Character Sequences

Suspended nonspacing character sequences occur when the active virtual terminal becomes inactive after a nonspacing character sequence is started but before the sequence completes. In the case of a suspended nonspacing character sequence, the VTMP continues nonspacing character processing after the virtual terminal reactivates. Nonspacing character processing continues using the rules for valid or invalid nonspacing character sequences depending on which keys are pressed. The following pages give you specific examples of nonspacing character processing.

## Nonspacing Character Processing Examples

A valid nonspacing character sequence causes a single accented character to be returned. A nonspacing character followed by a space character is a valid nonspacing character sequence, and returns the accent itself as a single character. For example:

<b>1st Key Pressed</b>	<b>2nd Key Pressed</b>	<b>Returned</b>
Grave `	e	è e Grave (0x8a) – 1 character
Grave `	Space	` Grave Accent (0x60) – 1 character

An invalid nonspacing character sequence causes the accent character to be returned, followed by the code for the key pressed after the nonspacing key.

<b>1st Key Pressed</b>	<b>2nd Key Pressed</b>	<b>Returned</b>
Grave `	z	` Grave Accent (0x60) – 2 characters z (0x7a)
Acute ´	PF1	´ Acute Accent (0xef) – 1 character PF1 (0x1b5b00000171)

---

An invalid nonspacing character sequence (*nonspacing character - nonspacing character*) causes the first nonspacing character of the sequence to be passed to the application and the next nonspacing character starts a new nonspacing character sequence.

1st Key Pressed	2nd Key Pressed	3rd Key Pressed	Returned
Grave `	Acute ´	e	` Grave Accent (0x60) ´ e Acute (0x82) – 2 characters

When the virtual terminal is deactivated (either through user action or by the system) immediately after a nonspacing character is pressed, then reactivation of the virtual terminal causes processing to continue using either the rule for valid nonspacing character sequences or the rule for invalid nonspacing character sequences, as appropriate. Note that the nonspacing character is not forgotten. For example:

1. A user presses the ` (*Grave Accent*) nonspacing character, then presses **Window**. Nothing is returned, the virtual terminal is deactivated, and another task is done. When the user returns, the virtual terminal is reactivated, the nonspacing character is *remembered*, so that when the user then presses the e, an è (*e Grave*) character is returned. For example:

1st Key Pressed	2nd Key Pressed	Returned
Grave `	e	è e Grave (0x8a) – 1 character

- 
2. A user presses the ' (*Acute Accent*) nonspacing character, but before the user can complete the sequence a system message is presented. The virtual terminal is deactivated. When the virtual terminal is reactivated, the fact that an ' (*Acute Accent*) nonspacing character was pressed is remembered by the VTMP. If the user forgot that he already pressed a nonspacing character, and presses it again, followed by *e*, then two characters ' (*Acute Accent*) and *é* (*e Acute*) are returned. If the user remembers that he had pressed a nonspacing character and immediately on return presses *e*, then one character is returned *é* (*e Acute*). For example:

1st Key Pressed	2nd Key Pressed	3rd Key Pressed	Returned
Acute '	Acute '	e	Acute Accent ' (0xef) é e Acute (0x82) – 2 characters
Acute '	e		é e Acute (0x82) – 1 character

---

## Appendix B. Differences Between the 101-, 102-, and 106-Key Keyboards

This appendix details the differences between the physical keyboard layouts for the 101-, 102-, and 106-key keyboards.

### Differences Between The 101- and 102-Key Keyboards

The differences between the 101-key (United States) and the 102-key keyboards include the following:

- The US 101-key keyboard has a double wide **Carrier Return (Enter)** key (position codes 42 and 43) and generates position code 43 when pressed.
- The US 101-key keyboard left **Shift** key (position codes 44 and 45) is twice as wide as the 102-key keyboard left **Shift** key and generates position code 44 when pressed.
- The 102-key keyboard **Carrier Return (Enter)** key (position codes 29 and 43) is twice as high as the US **Carrier Return** key, and generates position code 43 when pressed.
- The 102-key keyboard left **Shift** key (position code 44) generates position code 44 when pressed and, therefore, position 45 is labeled.
- Position code 42, which is suppressed on the US 101-key keyboard, is available for assignment and is labeled on the 102-key keyboard.
- Position code 29, which is available in the US 101-key keyboard is suppressed on the 102-key keyboard.
- For some countries, besides having an additional key in the physical keyboard arrangement, *nonspacing characters* are also defined. These nonspacing characters are used in a two-key sequence to construct accented characters. The nonspacing characters, called *diacritics*, are national characters, such as acute accent, grave accent, and circumflex accent.

The 101- and 102-key keyboards are shown on Figure 1-8 on page 1-33 and Figure 1-9 on page 1-34.

---

## Differences Between The 101- and 106-Key Keyboards

The main differences between the US 101-key keyboard and the Japanese 106-key keyboard are:

- The US **Caps Lock** key (key position 30) becomes the Katakana **Shift** key.
- The left **Alt** key (key 60) becomes the alphameric shift key on the Japanese keyboard. The Base, Shift, and Ctrl states of this key are ignored.
- The Caps Lock function is moved to the Alt state of the alphameric **Shift** key (key position 60). It functions in the normal fashion.
- The space bar is divided into several additional keys (key positions 131, 61, 132, and 133). Key position 61 is the space, and returns the same scan code as the US 101-key keyboard. Key positions 131, 132, and 133 are for the Phonetic to Kanji Conversion (PKC) and are ignored.
- Key position 29 is included with the **Enter** key (key 43).
- Key positions 14, 42, and 56 are available.
- Some of the key positions from key position 1 to key position 64 are different.

The 101- and 106-key keyboards are shown on Figure 1-8 on page 1-33 and Figure 1-10 on page 1-35.

## Input Processing Examples

The headings in the input examples have the following meanings:

- **XLATE(P0)** – Keyboard translation table entry for Code Page P0.
- **XLATE(P1)** – Keyboard translation table entry for Code Page P1.
- **XLATE(P2)** – Keyboard translation table entry for Code Page P2.

0x41	0x41	A a Capital

**Example 1.2.** The keyboard translate table contains 0x80 for Code Page P0. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x80 to the application and causes the *Ç (c Cedilla Capital)* to be echoed to the display.

<b>XLATE(P0)</b>	<b>RETURNED</b>	<b>ECHOED</b>
0x80	0x80	Ç c Cedilla Capital

---

**Example 1.3.** The keyboard translate table contains 0x41 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x1fc1 to the application and causes the  $\beta$  (*s Sharp*) to be echoed to the display.

<b>XLATE(P1)</b>	<b>RETURNED</b>	<b>ECHOED</b>
0x41	0x1fc1	$\beta$ s Sharp

**Example 1.4.** The keyboard translate table contains 0x80 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x1e80 to the application and causes the  $\check{s}$  (*s Caron Small*) to be echoed to the display.

<b>XLATE(P1)</b>	<b>RETURNED</b>	<b>ECHOED</b>
0x80	0x1e80	$\check{s}$ s Caron Small

**Example 1.5.** The keyboard translate table contains 0x41 for Code Page P2. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x1dc1 to the application and causes the  $\nu$  (*Nu Small*) to be echoed to the display.

**Note:** Characters not assigned to any one key on the keyboard can be input from the numeric keypad or the Ctrl state. To input a character using these methods, enter the keys corresponding to the **Internal Code** for the character as found in Figure 1-4 on page 1-11, Figure 1-5 on page 1-18, or Figure 1-6 on page 1-25. The hexadecimal value shown in the **Internal Code** column must be converted and keyed in as a decimal value when using the numeric keypad.

**Example 1.7.** The value 0x41 is entered from the numeric keypad. Since this value is not preceded by a single shift control, the 0x41 is sent to the application and the active graphic character set (P0) is used to display the character.

<b>KEYPAD</b>	<b>RETURNED</b>	<b>ECHOED</b>

**Example 1.8.** The value 0x1f (SS1) is entered from the numeric keypad or the Ctrl state. Then the value 0xc1 is entered from the numeric keypad. The 0x41 index into the Code Page P1 display symbols is used to display the character.

## Examples of Nondefault Input Processing

For the following input examples, assume these conditions:

- Default keyboard translation table entries
- Set Graphic Set G1 to P1 followed by a shift out control
- G1 is the active display character set
- G1 is set to P1.

Please note that the character echoed for unprefixed code points is different than the default case. However, the character echoed for prefixed code points is the same as in the default case. A few examples of the characters that are the same as the default cases are included in the examples below.

**Example 2.1.** The keyboard translate table contains 0x41 for Code Page P0. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x41 to the application and causes the  $\beta$  (*s Sharp*) to be echoed to the display because the active display set, G1, is set to P1.

<b>XLATE(P0)</b>	<b>KEYPAD</b>	<b>RETURNED</b>
0x41	0x41	$\beta$ s Sharp

**Example 2.2.** The keyboard translate table contains 0x80 for Code Page P0. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x80 to the application and causes the  $\check{s}$  (*s Caron Small*) to be echoed to the display because the active display set, G1, is set to P1.

<b>XLATE(P0)</b>	<b>KEYPAD</b>	<b>RETURNED</b>
0x80	0x80	$\check{s}$ s Caron Small

**Example 2.3.** The keyboard translate table contains 0x41 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x1fc1 to the application and causes the  $\beta$  (*s Sharp*) to be echoed to the display because the active display set, G1, is set to P1.

<b>XLATE(P1)</b>	<b>KEYPAD</b>	<b>RETURNED</b>
0x41	0x1fc1	$\beta$ s Sharp

The echoing of this symbol bypasses the active graphic display set and is not affected by the SG0/SG1 and shift in/shift out controls.

---

**Example 2.4.** The keyboard translate table contains 0x80 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the VTMP sends 0x1e80 to the application and causes the ſ (*s Caron Small*) to be echoed to the display.

<b>XLATE(P1)</b>	<b>KEYPAD</b>	<b>RETURNED</b>
0x80	0x1e80	ſ s Caron Small

The echoing of this symbol bypasses the active graphic display set and is not affected by the SG0/SG1 and shift in/shift out controls.

## Examples of Output Processing

The headings in the output examples have the following meaning:

- **OUTPUT\_BUFFER** – Character(s) in application output buffer.
- **DISPLAY** – Character shown on the display.

## Examples of Default Output Processing

For the following output examples, assume the default conditions:

- G0 is the active display character set
- G0 is set to P0.

**Example 3.1.** The unprefixed code point 0x41 is sent in the application display output data stream. Since G0 is the active display character set and is set to P0, *A (a Capital)* is displayed.

<b>OUTPUT_BUFFER</b>	<b>DISPLAY</b>
0x41	A a Capital

**Example 3.2.** The unprefixed code point 0x80 is sent in the application display output data stream. Since G0 is the active display character set and is set to P0, *Ç (c Cedilla Capital)* is displayed.

<b>OUTPUT_BUFFER</b>	<b>DISPLAY</b>
0x80	Ç c Cedilla Capital

**Example 3.3.** The SS1 prefixed code point 0xc1 is sent in the application display output data stream. This is a request to display a character from the left half of code page P1. The high-order bit of the 0xc1 is reset to produce 0x41. The character at the 0x41 offset into Code Page P1 is displayed.

<b>OUTPUT_BUFFER</b>	<b>DISPLAY</b>

## Part 3. Keyboard Tables

---

## **Appendix D. Belgian-French/Dutch Keyboard Layout and Table**

---

This appendix contains the keyboard layout and keyboard table information for the Belgian-French/Dutch keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

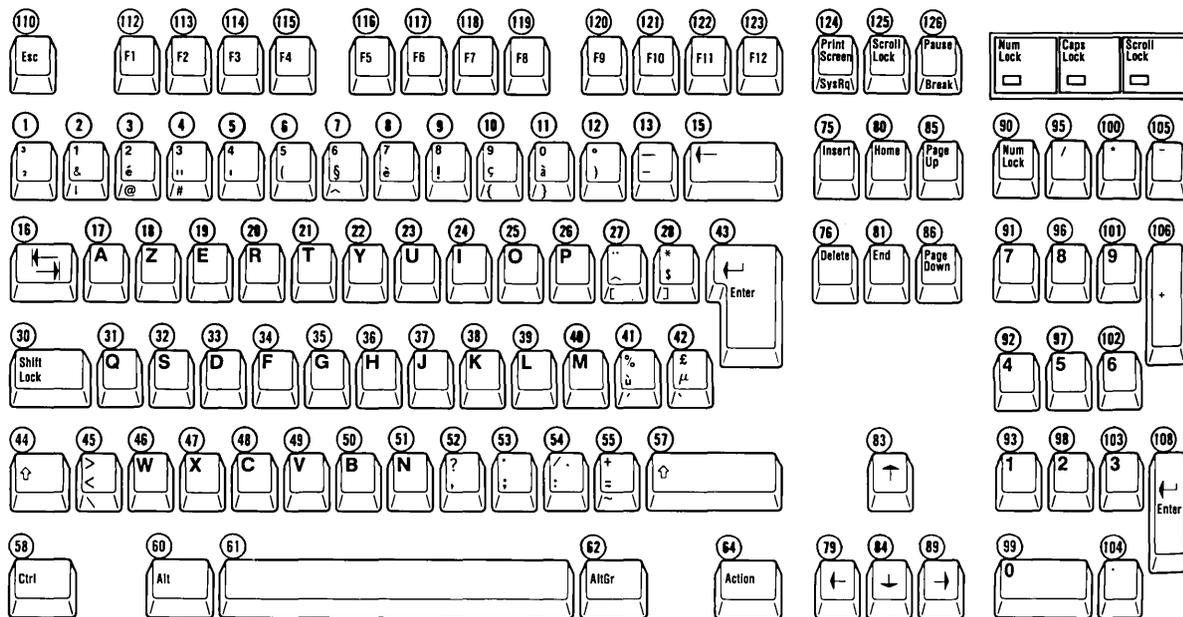

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

# Appendix E. Canadian/French Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Canadian/French keyboard.

The listing below:

- 1.- Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

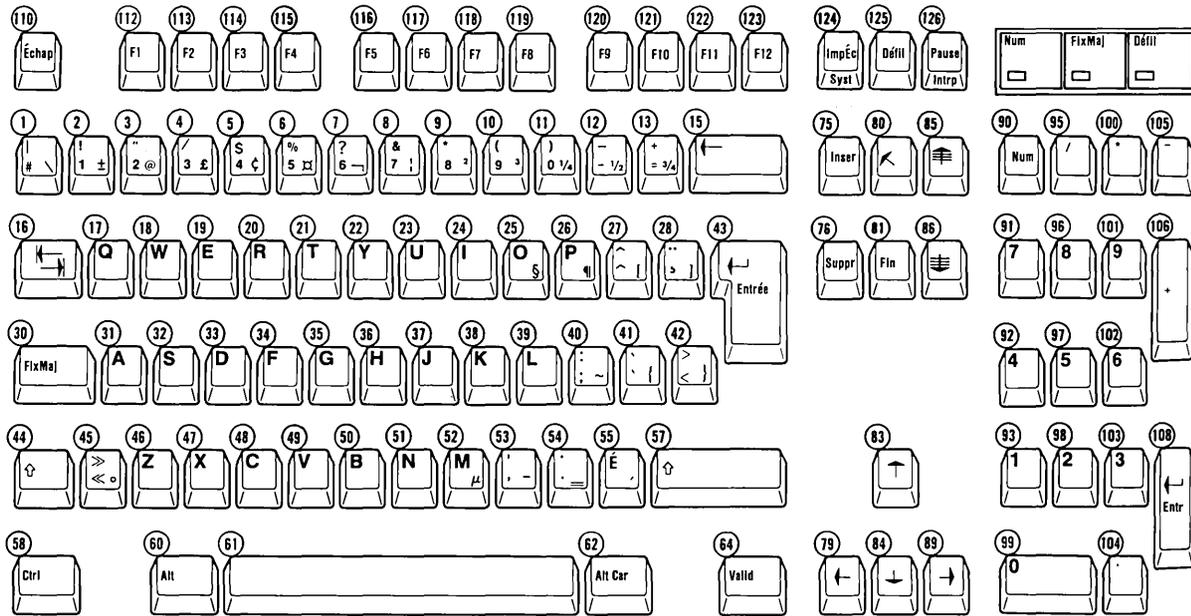

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

## Appendix F. Danish Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Danish keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

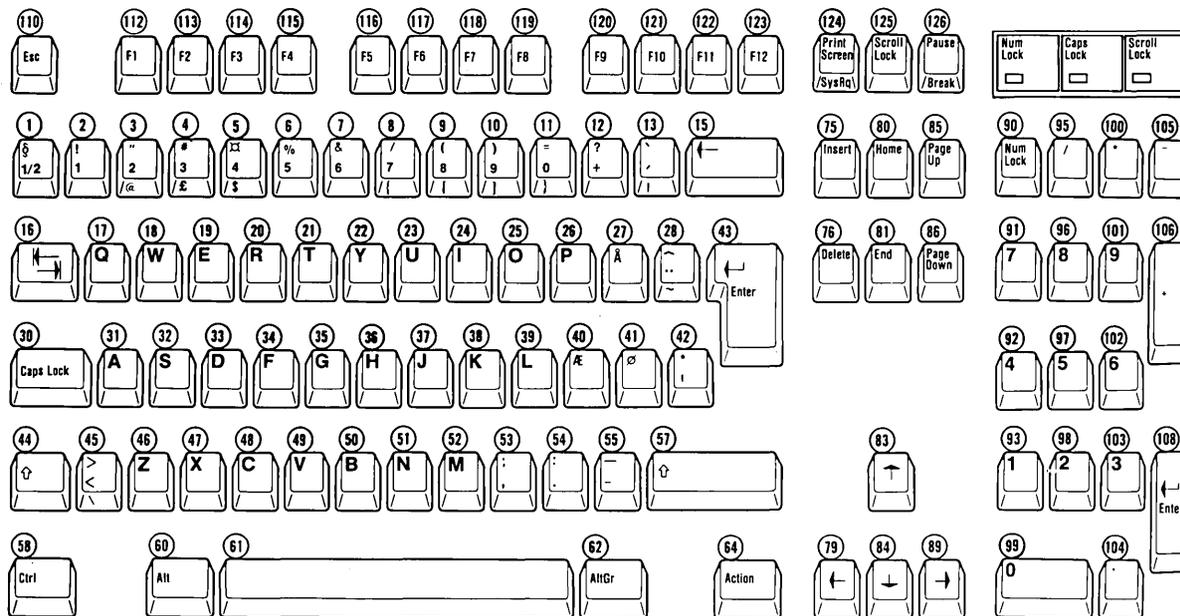

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

# Appendix G. Finnish/Swedish Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Finnish/Swedish keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

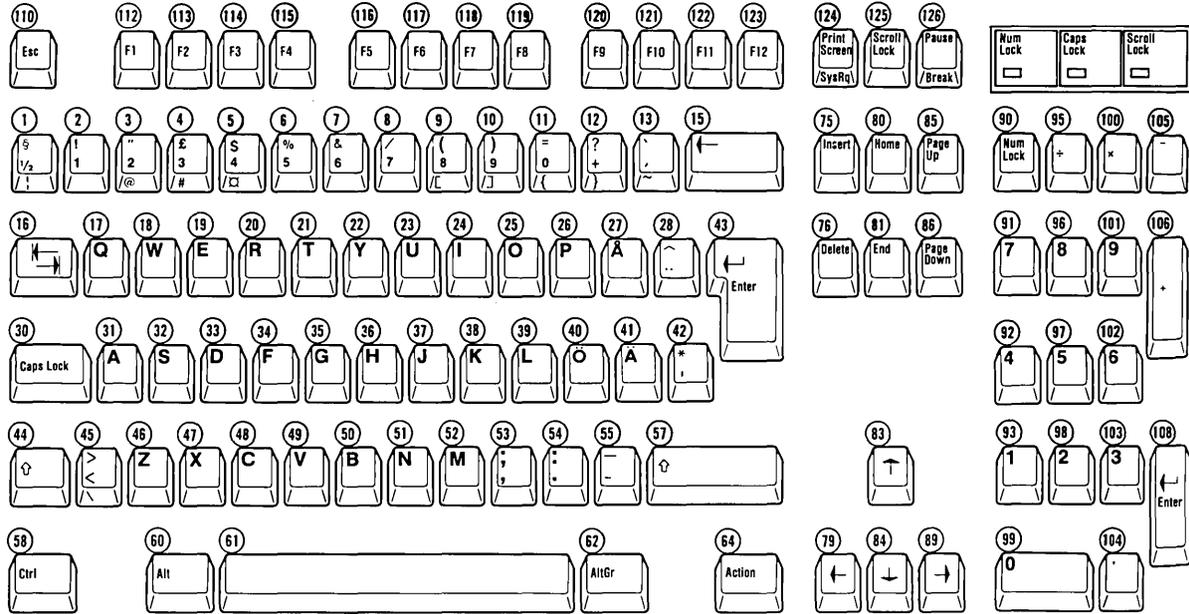

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

## Appendix H. French Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the French keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

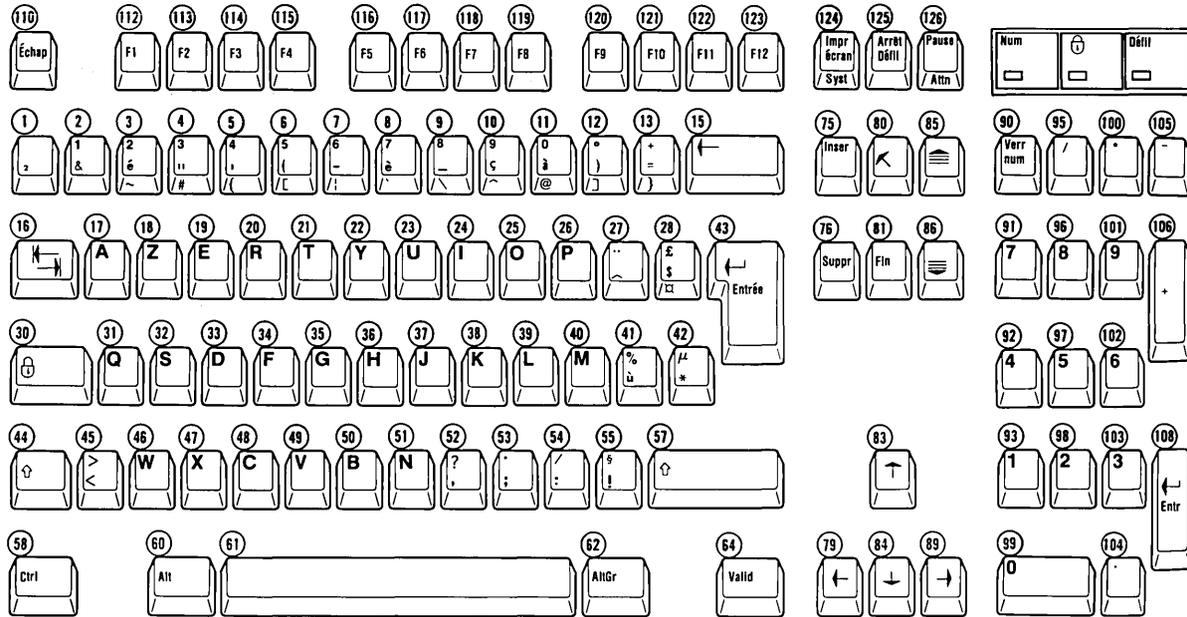

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

## Appendix I. German Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the German keyboard.

The listing below:

1. Specifies the key assignments used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

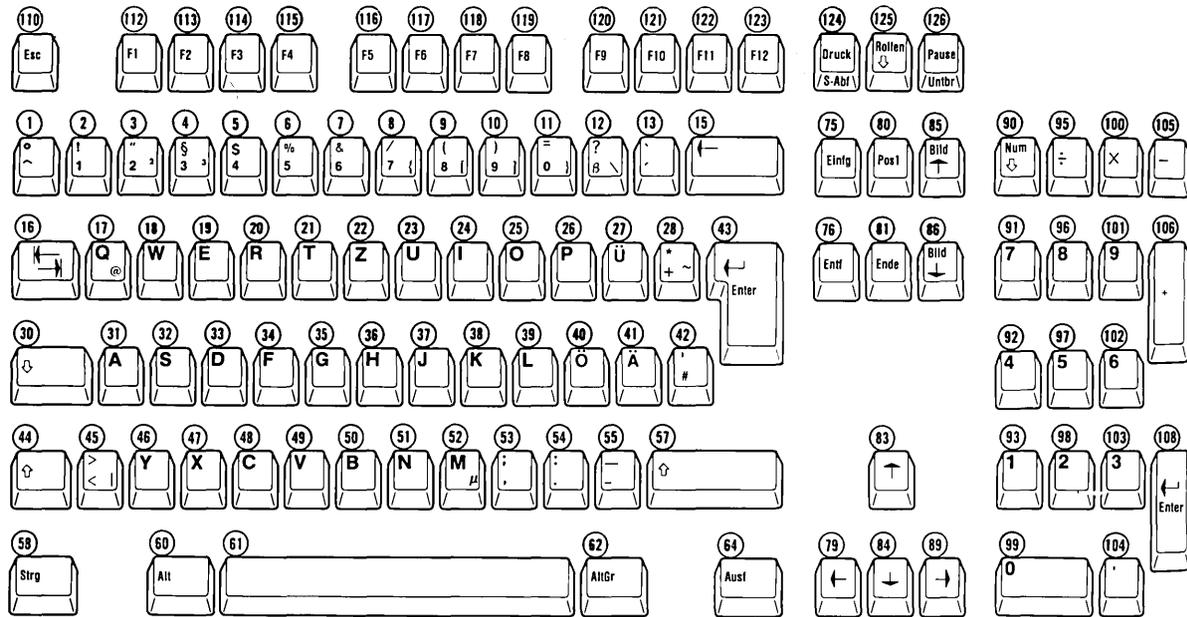

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the Alt key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

## Appendix J. Italian Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Italian keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

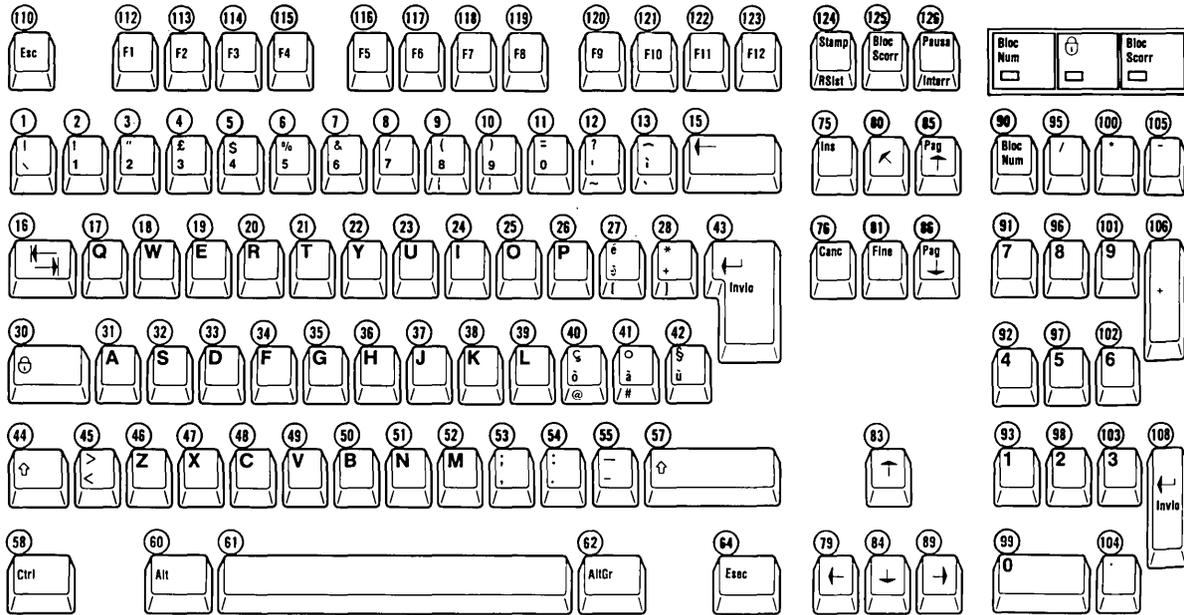

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

## Appendix K. Japanese Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Japanese keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, or Alt.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

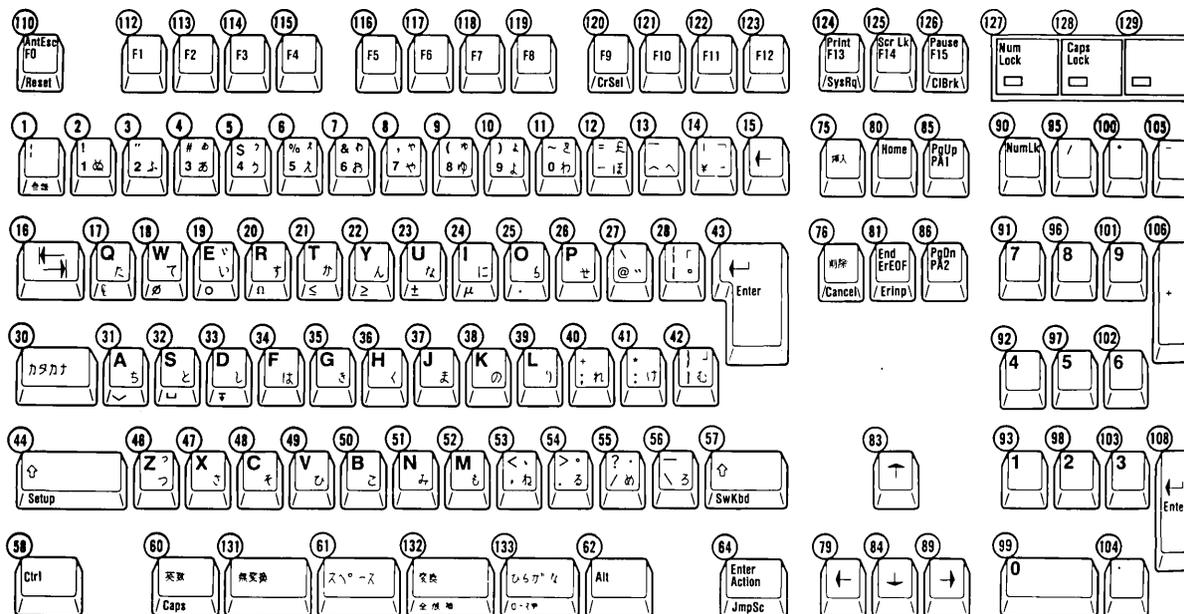

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

## Appendix L. Norwegian Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Norwegian keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

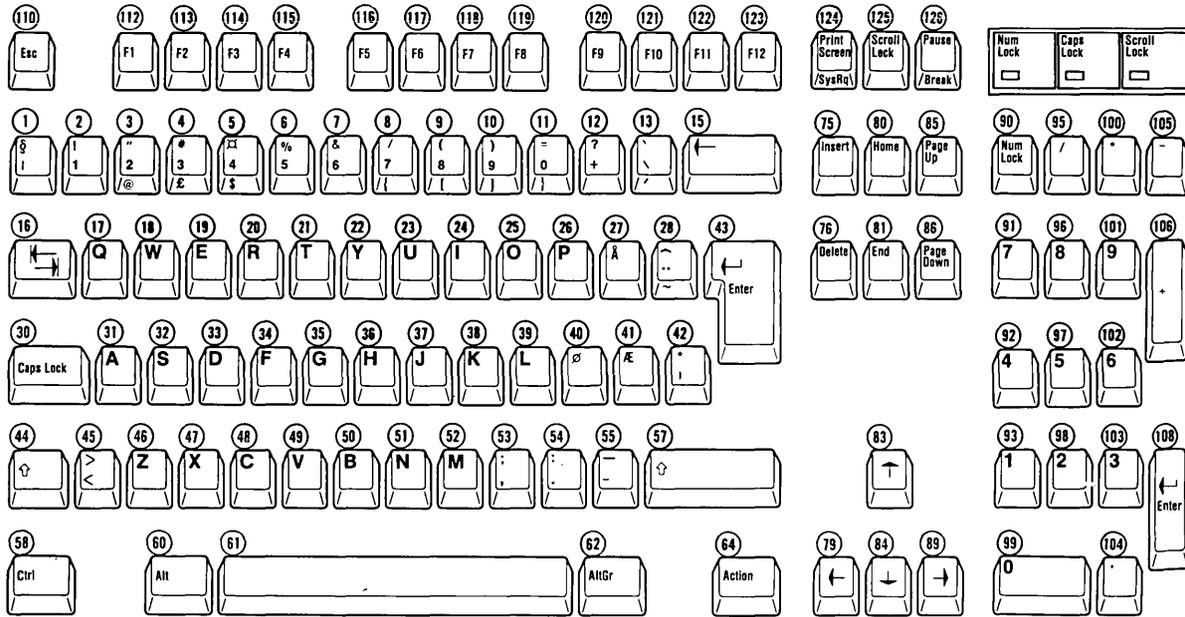

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

# Appendix M. Portuguese Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Portuguese keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

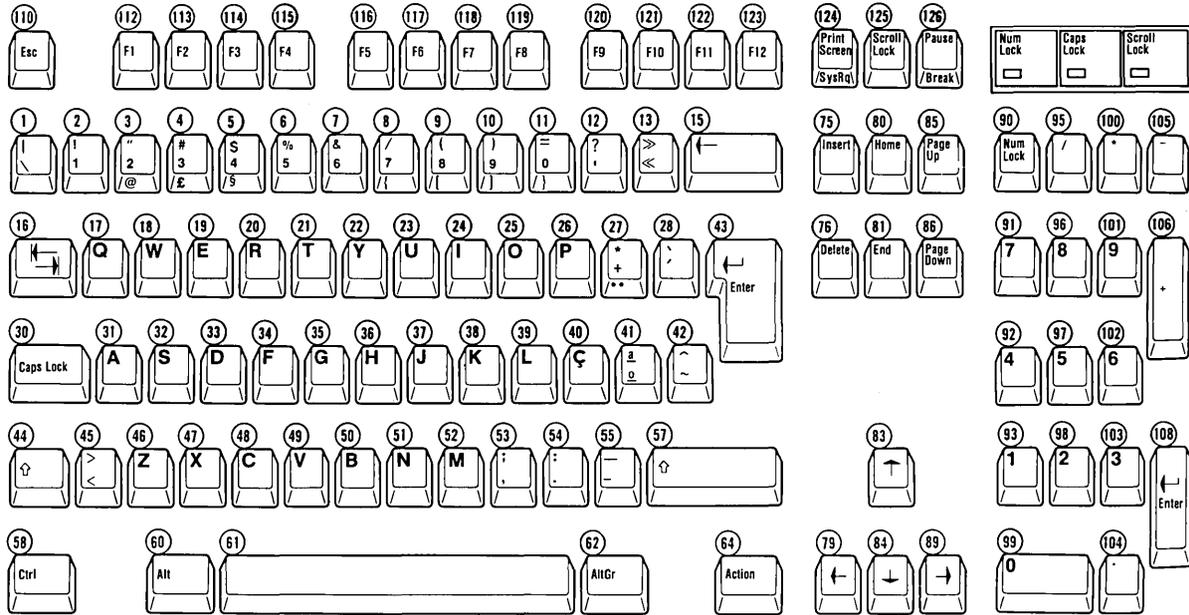

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

## Appendix N. Spanish Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the Spanish keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

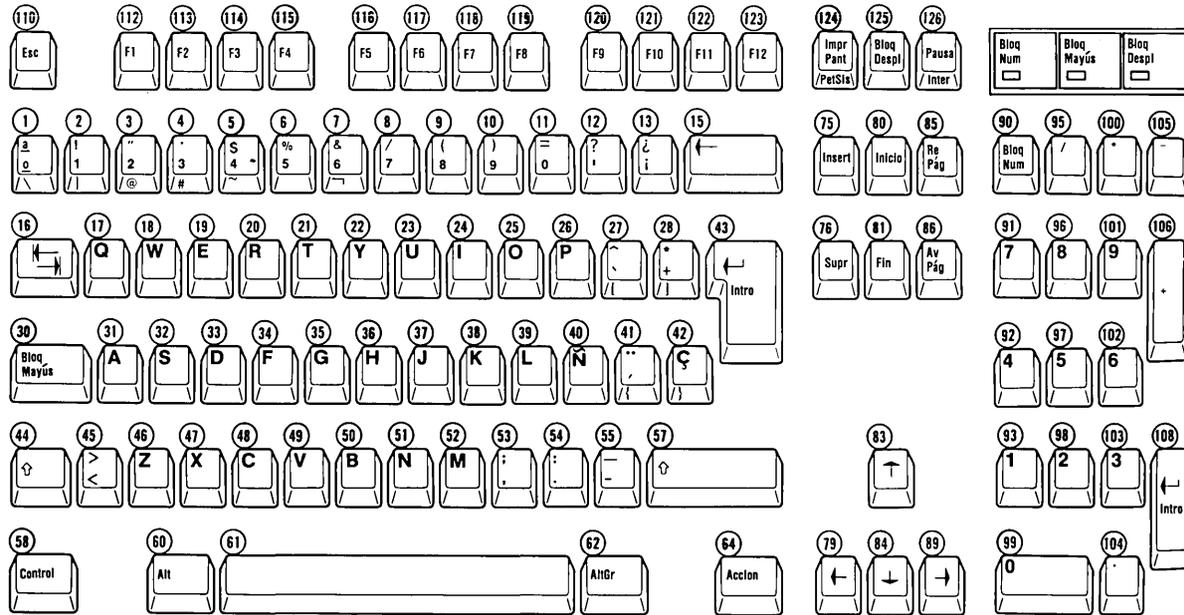

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

# Appendix O. Swiss Keyboard Layout with French Table

---

This appendix contains the keyboard layout and keyboard table information for the Swiss/French keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

# Appendix P. Swiss Keyboard Layout with German Table

---

This appendix contains the keyboard layout and keyboard table information for the Swiss/German keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

# Appendix Q. UK English Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the UK English keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, Alt, or AltGr.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**g (alt gr)** – **AltGr** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

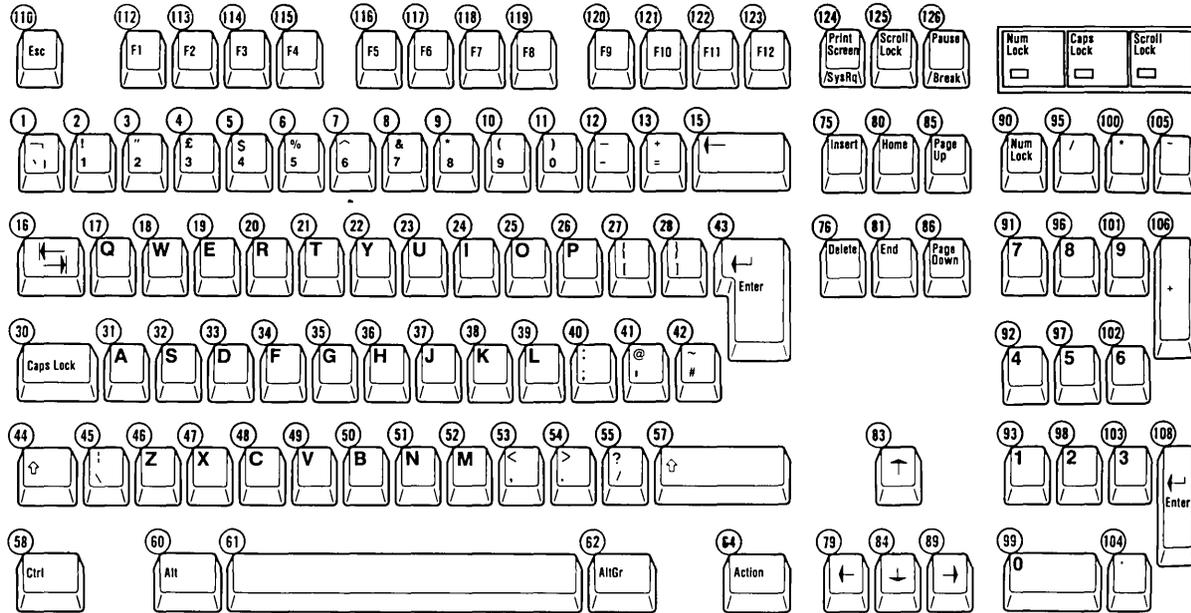

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the Alt key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

# Appendix R. US English Keyboard Layout and Table

---

This appendix contains the keyboard layout and keyboard table information for the US English keyboard.

The listing below:

1. Specifies the key assignments to be used on the keyboards.
2. Indicates the symbol that is engraved on the key.
3. Gives the character sequences that are to be produced by the Virtual Terminal Mode Processor (VTMP).

Refer to the following listing for the meanings of the column headings:

**Key Posn** – Keyboard key position.

**Shift** – The shift state of the position: Base, Shift, Ctrl, or Alt.

**Assignment** – The character or control assigned to that key.

**Keyboard Definition** – Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

**nnn** – One-byte key position number being defined.

**s** – Shift state being defined. Bits 1-3 should be set to:

**b (base)** – No **Shift** key is pressed.

**s (shift)** – Either left or right **Shift** key is pressed.

**c (control)** – **Ctrl** key is pressed.

**a (alt)** – **Alt** key is pressed.

**t** – Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

**c** – Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

**f** – Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

**s** – String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the

---

specified code page. No string specifications are included in the default keyboard layouts.

**d** – Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

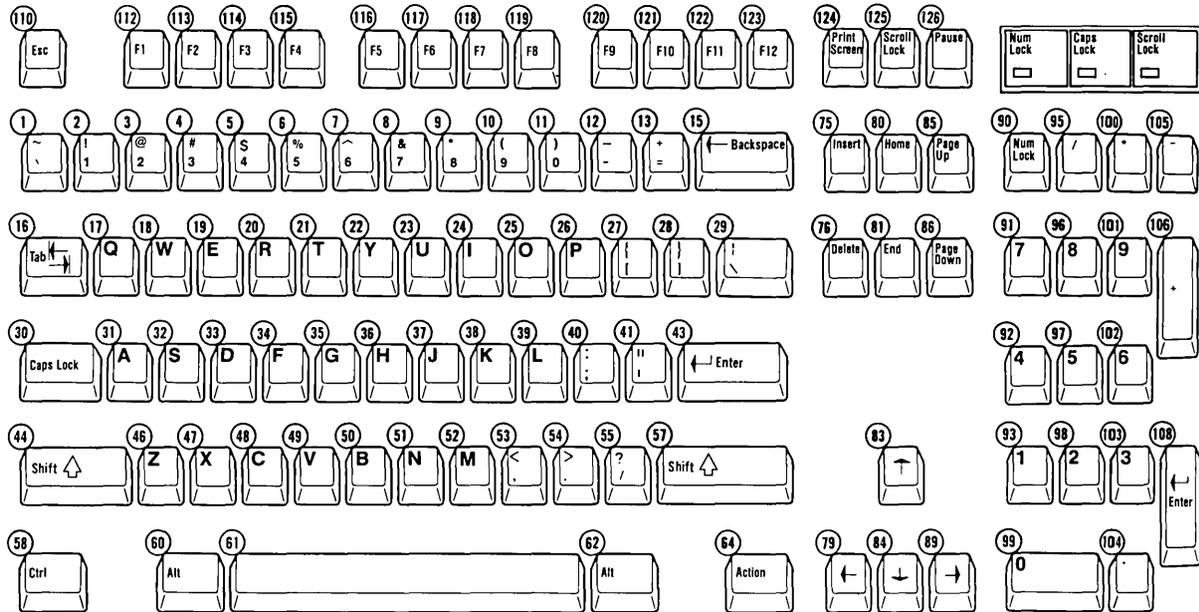

**Returned String** – Specifies the data that is returned to the program that is reading the keyboard.

**Notes** – Specifies additional information. Entries in this column include:

- **CL** – This key is affected by **Caps Lock**.
- **DK** – This key is a dead character on this key state.
- **P1** – This key is a character from Code Page P1.
- **P2** – This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the **Alt** key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

**font.** A family or assortment of characters of a given size and style.

**function.** A synonym for procedure. The C language treats a function as a data type that contains executable code and returns a single value to the calling function.

**function keys.** Keys that request action but do not display or print characters. Included are the keys that normally produce a printed character, but when used with a code key produce a function instead. Compare with *character key*.

**graphic character.** (1) A character that can be displayed or printed. (2) A graphic symbol, such as a numeric, alphabetic, or special character.

**graphic character set.** A set of graphic characters, treated as an entity.
