COLOR MONITOR

## MODEL

**AUM-1371A**  
**AUM-1371A(C)**

### CAUTION

Before servicing this product, it is important that the serviceman reads the "SAFETY PRECAUTIONS" and "PRODUCT SAFETY NOTICE" in this service manual.

### SPECIFICATIONS

• Picture tube	13" viewable, 90 degree deflection .31 mm trio dot pitch Super high contrast glass, Non-glare P22, Medium-short persistence High voltage: 22.5kV (at 0mA)
• Video Band width	30 MHz
• Resolution	Mode 1. RGB TTL/Analog 800 dots Horizontal 560 lines Vertical Mode 2. Composite Video 300 dots Horizontal 500 line Vertical
• Input Signal	Comp. video: NTSC RGB: video: TTL Positive 16/64 Colors Analog 0.6 Vp-p positive Sync.: Separate sync. TTL±HD, ±VD Comp. sync. TTL ±HD/VD
• Connector	BNC Jack D-Sub 9-pin D-Sub 25-pin
• Synchronization	Horizontal: 15.6 kHz to 35 kHz (Automatically) Vertical: 45 Hz to 75 Hz (Automatically)

• Power Input	NTSC.... AC 120 V 60 Hz
• Power Consumption	90 watts
• Dimension	362 mm(W)×328 mm(H)×383 mm(D) 14-1/4"×13"×15-25/32"
• Unit Net Weight	12.8 kg (28.2 lbs)
• Special Features	* Automatic tracking of wide rang horizontal and vertical scanning frequencies. f(H): 15.6 ~ 35 kHz f(V): 45 ~ 75 Hz * Size and position of the screen can be adjusted with external controls. * High-resolution color CRT, 0.31mm trio dot pitch, diamond matte coating super-high Contrast glass. * Supports wide variety of input signals such as, video composite, RGBI TTL, RGB analog and TTL monochrome. * Diverse displays are obtainable by inputs of various signals such as composite video, RGB TTL, analog and monochrome.

# MITSUBISHI ELECTRIC CORPORATION

Head Office: Mitsubishi Denki Building. Marunouchi Tokyo, Japan  
Cable Address: MELCO TOKYO

## SAFETY PRECAUTIONS

NOTICE. Observe all cautions and safety related notes located inside the color monitor cabinet and on the color monitor chassis.

### WARNING

1. Operation of this color monitor, outside the cabinet or with the cover removed, involves a shock hazard from the color monitor power supplies. Work on the color monitor should not be attempted by anyone who is not thoroughly familiar with precautions necessary when working on high-voltage equipment.
2. Do not install, remove or handle the picture tube in any manner unless shatter-proof goggles are worn. People not so equipped should be kept away while the picture tube is being handled. Keep the picture tube away from the body while handling.

### X-RADIATION WARNING

The surface of the picture tube may generate X-Radiation. Precaution during service and, if possible, the use of a lead apron is recommended for shielding while handling.

When replacing the picture tube, use only the designated replacement part since it is a critical component with regard to X-Radiation as noted above. (No high-voltage adjustments are provided.) The high-voltage specification is described on page 1.

### LEAKAGE CURRENT CHECK

Before returning the color monitor to the customer, it is recommended that leakage current be measured according to the following methods.

#### 1. Cold Check

With the AC plug removed from the Power source, place a jumper across the two AC plug prongs. Turn the color monitor AC switch on. Using an ohm-meter, connect one lead to the jumpered AC plug and touch the other lead to each exposed metal part (screwheads, metal overlays, control shafts, etc.) particularly any exposed metal part having a return path to the chassis. Exposed metal parts having a return path to the chassis should have a minimum resistance reading of 1 megohm. Any resistance below this value indicates an abnormality which requires corrective action. Exposed metal parts not having a return path to the chassis will indicate an open circuit.

#### 2. Hot Check (AUM-1371A · AUM-1371A(C))

The test sequence, with reference to the measuring circuit in Fig.1, is as follows:

- (1) With switch S1 open, the color monitor is to be connected to the measuring circuit. Immediately after connection, the leakage current is measured using both positions of switch S2, and with the switching devices in the color monitor in all of their operating positions.
- (2) Switch S1 is then to be closed, energizing the color monitor, and immediately after closing the switch, the leakage current is to be measured using both positions of switch S2, and with the switching devices in the color monitor in all of their operating positions.

Current measurements of items (1) and (2) are to be repeated after the color monitor has reached thermal stabilization.

The leakage current shall not be more than 3.5mA.

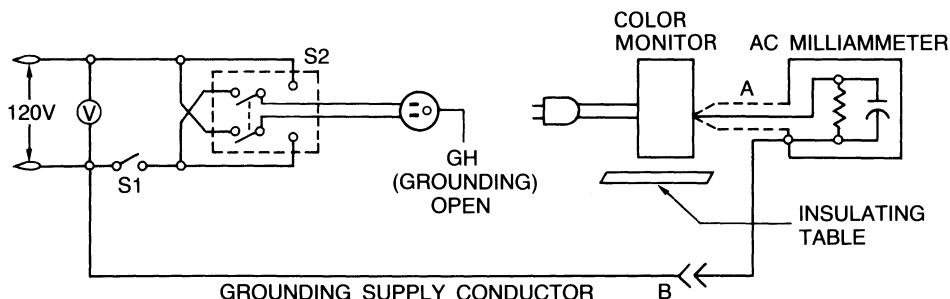

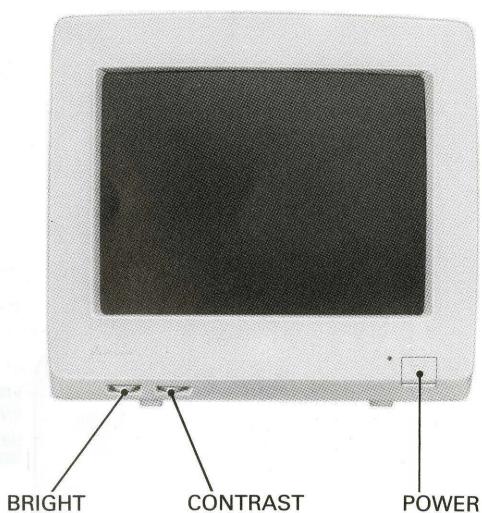

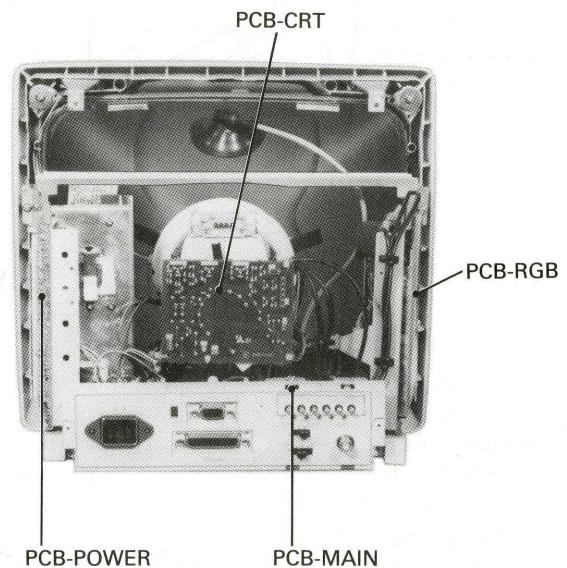

Fig. 1

## PRODUCT SAFETY NOTICE

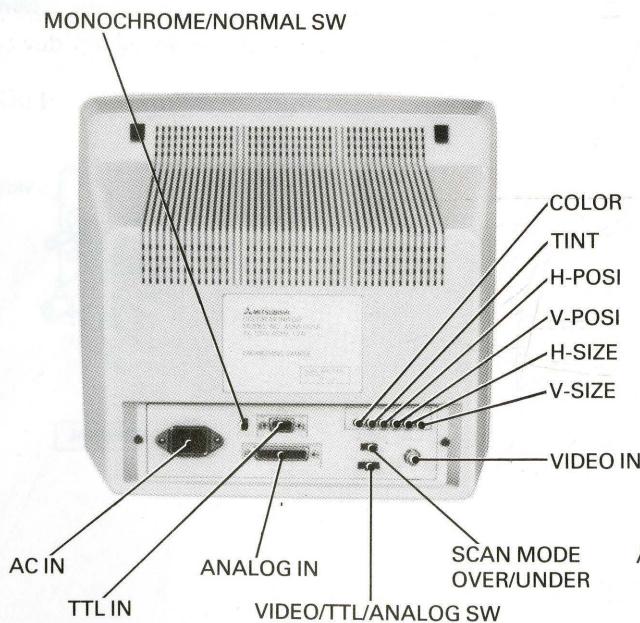

Many electrical and mechanical parts in color monitor have special safety related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this service manual. Electrical components having such features are identified by shading on the schematic diagram and the parts list of this service manual and by marking on the supplementary sheet for this chassis to be issued subsequently. Therefore replacements for any safety parts should be identical in value and characteristics.

## ★ CHECK AFTER ADJUSTMENT

### Test of X-radiation protector circuit

- 1) Set INPUT SIGNAL SELECT SWITCH S291 at the "VIDEO" position.  
Do not supply video signal.
- 2) Turn off the Power switch.
- 3) Connect a  $180k\Omega$ -J (R-composite 1/4W) resistor parallel with R799 in the horizontal deflection circuit.
- 4) Turn on the power switch.
- 5) Make sure that X-radiation protector has worked, namely, horizontal oscillation circuit has turned off.
- 6) Turn off the Power switch.
- 7) Remove the resistor connected parallel with R799.

### SERVICE ADJUSTMENT

#### [1] +B4 Voltage Adjustment

- 1) Receive a white pattern signal. <M2-1>
- 2) Set RGB-SUB-CONT control VR6X1 at the center position, CONTRAST control VR692 at maximum position and BRIGHT control VR691 at the click stop position.
- 3) Make sure the AC power supply voltage is at the specified value.
- 4) Set SERVICE SWITCH S691 on PCB RGB at the inside position picture tube side to obtain a horizontal line of low brightness across the screen.
- 5) Adjust CRT-BIAS (SCREEN) control VR592A until any of the red, blue or green horizontal line appear on the screen.
- 6) Return SERVICE SWITCH S691 at the center position.
- 7) Connect a DC voltmeter of 150 V full scale between the TP-9Z on the PCB-POWER and the chassis ground (-).
- 8) Adjust B4-ADJ control VR901 on the PCB-POWER for  $130 \pm 1$  V reading on the meter.

#### [2] Vertical Deflection Alignment <RGB>

- 1) Receive a cross-hatch signal. <M2-1>
- 2) Set V-POSI control VR291 on the rear panel so that the picture become center of raster and V-SIZE control VR291 so that vertical width becomes almost 176 mm.
- 3) Adjust V-LIN control VR402 for symmetry of vertical linearity.

- 4) Adjust V-SIZE control VR291 on the rear panel so that vertical width becomes  $176 \pm 1.5$  mm.

#### [3] Horizontal Deflection Circuit Alignment

<RGB>

##### Horizontal Low Frequency Adjustment

##### Horizontal Width Adjustment

VR709, VR770 is permanently sealed at factory. Do not attempt to readjust.

#### [4] RGB VIDEO Circuit

##### RGB TTL Input level adjustment

- 1) Receive a gray scale of 16 colors (R, G, B, I) signal. <M2-1>
- 2) Connect the oscilloscope across TP47 on PCB-RGB and ground.
- 3) Adjust T-BRT control VR2X1 so that the wave becomes  $0.68V_{p-p} \pm 0.02V$ .

##### RGB TTL SIGNAL White adjustment.

- 1) Receive a RGB TTL signal. <M2-1>
- 2) Set INPUT SIGNAL SELECT SWITCH S291 at the "TTL" position.
- 3) Set R, G, B-CUT-OFF control VR6R2, VR6G2, VR6B2 and SUB-BRT-control VR6X2 at full counterclockwise position.
- 4) Set R, G, B-DRIVE control VR6R0, VR6G0, VR6B0 at full clockwise position.
- 5) Set CRT-SCREEN control on the Flyback transformer at full counterclock wise position.
- 6) Set BRIGHT control VR691 at click stop position and CONTRAST control VR692 at maximum position.
- 7) Set SERVICE SWITCH S691 at the inside position (picture tube side).
- 8) Adjust CRT-SCREEN control until any of the red, blue or green horizontal line appear on the screen.
- 9) Adjust the CUT-OFF controls (VR6R2, VR6G2 or VR6B2) to produce a white horizontal line.
- 10) Return SERVICE SWITCH S691 at the outside position (CT connector side).
- 11) Adjust DRIVE control volume of two bright colors on the screen among R,G,B-DRIVE control VR6G0 VR6B0 and VR6R0 to obtain a pure peak white raster. (Signal: white pattern of TTL)

**RGB Analog Signal White ADJUSTMENT**

- 1) Set INPUT SIGNAL SELECT SWITCH S291 at the "ANALOG" position.
- 2) Receive a RGB ANALOG signal. (a gray scale of 16 graduations.)
- 3) Adjust SUB-BRT control VR6X2 to optimum brightness.

**Note:** Check overall black and white tone through the normal brightness and contrast range.  
If necessary, repeat steps from RGB TTL white adjust (7) to Analog white adjust (3).

**RGB BEAM CURRENT ADJUSTMENT**

- 1) Receive a TTL white raster (INTENSITY-"H") signal. <M2-1>
- 2) Connect a DC ammeter with 1 mA full scale between the test point TP9Z (+) and TP1Z (-) on PWB-MAIN.
- 3) Set BRIGHT control VR691 at click stop position, CONTRAST control VR692 at maximum position and H-SIZE control VR291 at minimum position.
- 4) Adjust SUB-CONT control VR6X1 for beam current of  $530^{+20}_{-0}\mu\text{A}$  on the meter.
- 5) Remove a DC ammeter from TP9Z and TP1Z.
- 6) Re-adjust HV-ADJ control VR770 so that a horizontal width becomes  $240 \pm 1$  mm.

**Note:** Re-adjust white adjustment at this time.

- 7) Adjust V-SIZE control VR291 so that a vertical width becomes  $176 \pm 1.5$  mm.

**FOCUS adjustment**

- 1) Receive a H-character (INTENSITY-"H") signal.
- 2) Adjust FOCUS control for best overall focus.

**[5] COMPOSITE VIDEO CIRCUIT ADJUSTMENT.****CHROMA · OSC · VECTOR adjustment <AUM-1371A. AUM-1371A(C)>**

- 1) Set INPUT SIGNAL SELECT SWITCH S291 at the "VIDEO" position.
- 2) Receive a NTSC color bar signal through "VIDEO IN" terminal.
- 3) Set TINT control and COLOR control on the rear panel to mid-position.
- 4) Short circuit the test points TP41 and TP42 with a short lead wire.
- 5) Connect a 270 kΩ resistor (composition 1/4W) across TP43 and TP44.
- 6) Adjust frequency control VC601 on PCB MAIN for almost color synchronization.
- 7) Remove the short lead wire and 270 kΩ resistor.
- 8) Set the oscilloscope to the X-Y mode. Connect the PCB-MAIN pin terminals TP46 (B-Y OUT) and TP45 (R-Y OUT) to the oscilloscope horizontal and vertical inputs respectively to display a vector pattern on the screen.
- 9) Adjust L601 so that a R-Y vector (Y-mode) becomes  $105^\circ$ .

**CHROMA, OSC, VECTOR adjustment.****<EUM1471A · EUM1471A(B)>**

- 1) Set INPUT SIGNAL SELECT SWITCH S291 at the "VIDEO" position.
- 2) Receive a PAL color bar signal through "VIDEO IN" terminal.
- 3) Set COLOR control on the rear panel to mid-position.
- 4) Short circuit the test points TP41 and TP42 with 2 short lead wire.
- 5) Connect 270 kΩ resistor (composition 1/4W) across TP43 and TP44.
- 6) Adjust OSC control VR631 for optimum color saturation.
- 7) Remove the short lead and 270 kΩ resistor. Receive a PAL G-card signal.
- 8) Set the oscilloscope to the X-Y mode. Connect TP46 (B-Y OUT) and TP45 (R-Y OUT) to the oscilloscope horizontal and vertical inputs respectively to display a vector pattern on the screen. (Fig. 6)

- 9) Set COLOR control VR291 on the rear panel at maximum position.
- 10) Observing the outermost dots which correspond to normal color bar, adjust the SCB-COLOR control VR601 and L633 on PCB-MAIN alternately to almost coincide the double dot pattern equally for all color points on the scope.
- 11) Observing around the center dots, adjust the coil L601 on PCB-MAIN so that the movable points on X axis or Y axis may come up to the nearest points of the center bright dot.
- 12) Repeat step 10) and 11) above so that the outer and center dots are converged.
- 13) Detune L601 so that the movable dots may be shifted and distinguished from the center bright point. (Fig. 6)
- 14) Observing the movable dots, A and B, adjust SUB-COLOR control VR601 on PCB-MAIN so that the double dots shifted in step 13) may come up to the nearest points of X or Y axis, (Fig. 6).
- 15) Adjust L633 slightly so that the outermost dots are converged again.
- 16) If the color of both sides are prominent slightly adjust the coil L601 so that the color of both sides is less on the average.

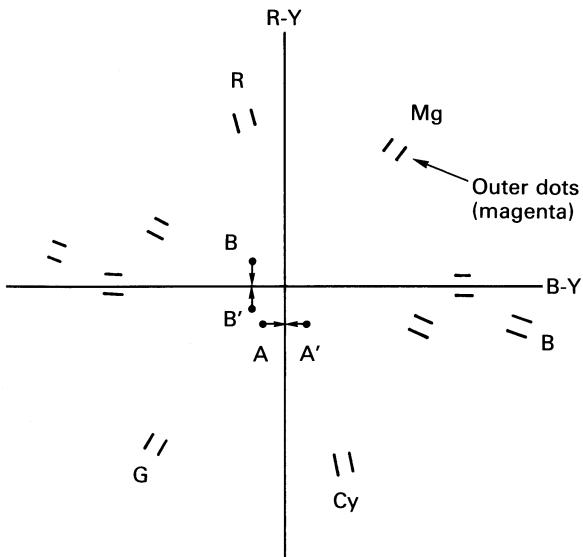

Fig. 6 Vector Pattern of G-card Signal

#### White adjustment

- 1) Set INPUT SIGNAL SELECT SWITCH S291 at the "VIDEO" position.
- 2) Receive a PAL or NTSC a monochrome signal through "VIDEO IN" terminal.
- 3) Set BRIGHT-control VR691 at click stop position, CONTRAST-control VR692 at maximum position, SUB-CONT control VR202 to mid-position, and C-DRIVE-R/C-DRIVE-B control VR2R0 and VR2B0 at about 45° counter clockwise position from the center.
- 4) Adjust C-DRIVE-R/C-DRIVE-B control VR2R0 and VR2B0 to obtain a pure peak white raster.
- 5) Adjust SUB-BRT control VR201 on PCB MAIN for optimum brightness.
- 6) Connect a DC ammeter (class 0.5 1 mA range) between the testpoint TP9Z (+) and TP1Z (-).
- 7) Adjust SUB-CONT control VR202 for beam current of NTSC MAX. in NTSC and  $380^{+20}_{-0}$   $\mu$ A in PAL on the meter.

#### Horizontal and Vertical Deflection adjust. (composite signal NTSC/PAL)

- 1) Receive a monochrome signal.
- 2) Short-circuit the test points TP8A and TP8B.
- 3) Adjust H-HOLD-C control VR501 for almost in synchronization.
- 4) Remove the short lead wire from TP8A and TP8B.
- 5) Adjust H-SIZE-C control VR704 at maximum position.
- 6) Adjust H-POSI-C control VR502, V-SIZE-C control VR406, V-POSI-C control VR404 for optimum position.

#### CHROMA adjustment (composite signal NTSC/PAL)

- 1) Receive a color bar signal.
- 2) Adjust COLOR-control on the rear panel for position.

## [6] PURITY AND CONVERGENCE

### Procedure

- 1) Remove the deflection yoke and the rubber wedges from the picture tube cone taking care not to strike or scratch the cone.
- 2) Clean the cement remaining on the deflection yoke and the surface of the picture tube cone.
- 3) Receive a full white raster.
- 4) Fit the deflection yoke on the neck of picture tube and push forward.
- 5) Fit C.P. (Magnet) Assembly to the neck of the picture tube and fasten with the screw at the position where the distance between 6-pole magnet end and the base of picture tube is as shown in Fig. 7.
- 6) Demagnetise at the front and sides of the picture tube with a degaussing coil.

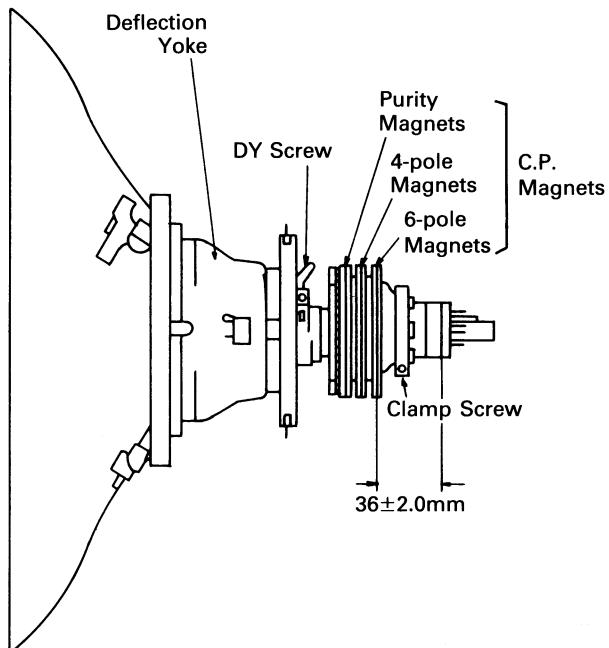

Fig. 7

### Preliminary Adjustment

#### 1 Purity

- 1) Short-circuit the base and emitter of B-OUT transistor Q6B0 on PCB-CRT to produce yellow raster.
- 2) With the deflection yoke positioned fully forward, adjust purity magnet so that the yellow ball is at the center of the screen. (Fig. 8)
- 3) Slide the deflection yoke slowly backwards to produce a uniform yellow raster.
- 4) Remove the shorting link on Q6B0.
- 5) Short-circuit the base and emitter of corresponding two transistors on PCB-CRT as indicated in Table 1 to produce green, red, and blue rasters and to verify their purity, and fasten the DY screw on the deflection yoke temporarily.
- 6) Remove the shorting leads from respective transistors.

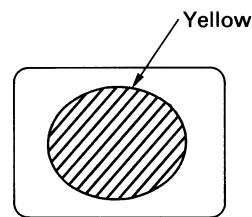

Fig. 8 Screen

Table 1 Transistors to be Short Base to Emitter to Produce Primary Color.

Transistor Raster	R-OUT Q6R0	G-OUT Q6G0	B-OUT Q6B0
Red	Open	Short	Short
Green	Short	Open	Short
Blue	Short	Short	Open

## 2 Static Convergence

- 1) Set BRIGHT control VR691 at click stop position and CONTRAST control VR692 at maximum position.
- 2) Adjust two 4-pole magnets to converge red and blue vertical and horizontal lines at the center of the screen.
- 3) Adjust two 6-pole magnets to converge the red and blue lines on green line at the center of the screen.

**Note:** 1. Adjustment of 4-pole magnets affects red and blue beams.  
2. Adjustment of 6-pole magnets affects red and blue beams. (Fig. 9)

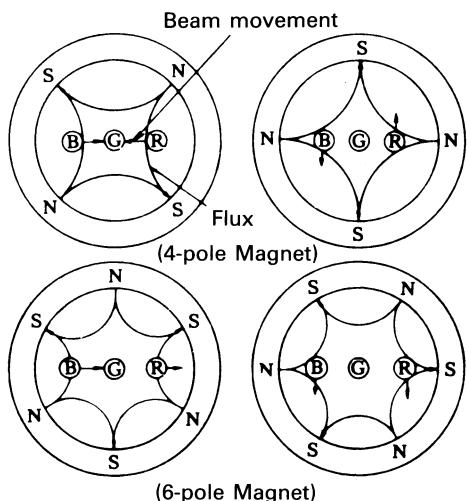

Fig. 9

## 3 Focus

If necessary, adjust focus. Ascertain that focus is optimum throughout the entire screen. Do not adjust focus after the following adjustments.

### Regular Adjustment

#### 1. Purity

- 1) Short-circuit the base and emitter of B-OUT transistor Q6B0 on PCB-RGB to produce yellow raster.
- 2) Loosen the deflection yoke screw and move it forwards and check that the yellow ball is at the screen center. (Fig. 8)  
If necessary, adjust purity magnets.
- 3) Slide the yoke backwards to produce a uniform yellow raster.
- 4) Short-circuit the base and emitter of corresponding two transistors on PCB-RGB as indicated in Table 1 to produce green, red, and

blue rasters and verify their purity, then fasten the DY screw of the deflection yoke temporarily.

- 5) If necessary, repeat steps above.

- 6) Fix the yoke in position using the DY screw.

**Note:** When adjusting the deflection yoke position, do not touch the purity ring magnets except where necessary.

## 2. Static Convergence

- 1) Receive a cross-hatch signal.
- 2) BRIGHT control VR691 at click stop position and CONTRAST control VR692 at maximum position.
- 3) Adjust 4-pole magnets to converge red and blue vertical and horizontal lines at the center of the screen.
- 4) Adjust 6-pole magnets to place the red and blue lines converged on the green lines.
- 5) If necessary, repeat steps 3) and 4) above.

## 3. Periphery of Convergence

- 1) Observe the vertical lines at the center of screen. If the red and blue vertical lines are shifted crossing with green vertical lines as shown in Fig. 10 (A), converge them by swinging yoke vertically.

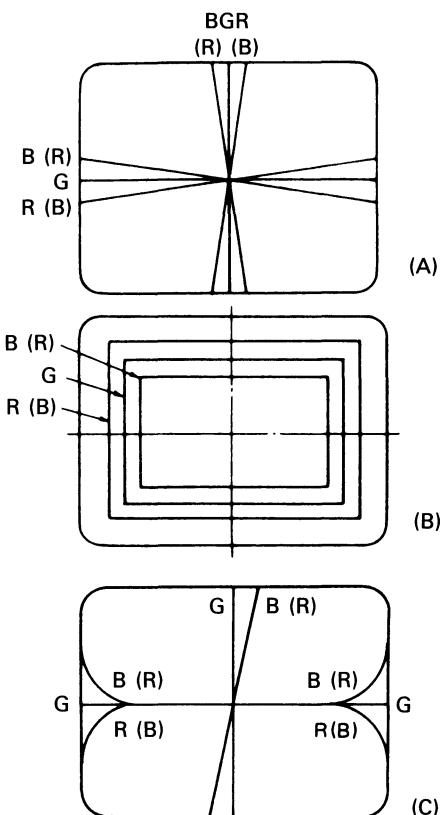

Observe the horizontal lines at the center of screen. If the red and blue horizontal lines are shifted crossing with green horizontal lines as shown in Fig. 10(A), converge them by adjusting BIAS magnet on the PCB-MID.

Then confirm that vertical lines at the screen center are also converged.

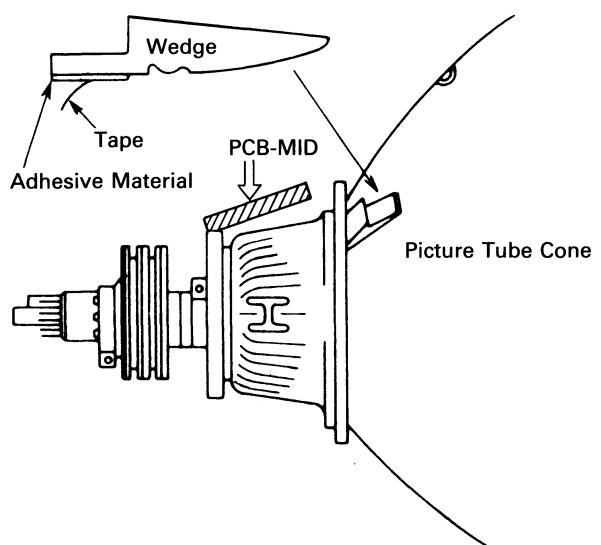

- 2) Observe the vertical lines at left and right centers of the screen as shown in Fig. 10 (B). If red or blue vertical lines are shifted against green vertical line, converge them by swinging yoke horizontally. Then confirm that the horizontal line both at top and bottom centers of the screen are also converged.
- 3) The shift of beams as shown in Fig. 10 (C) can be converged by rotating the entire deflection yoke. The rotation of the yoke should be made in consideration of a point where raster rotation and convergence compromise.

**Note:** Never perform focus adjustment after convergence adjustments. If focus is adjusted after convergence adjustment, check convergence again.

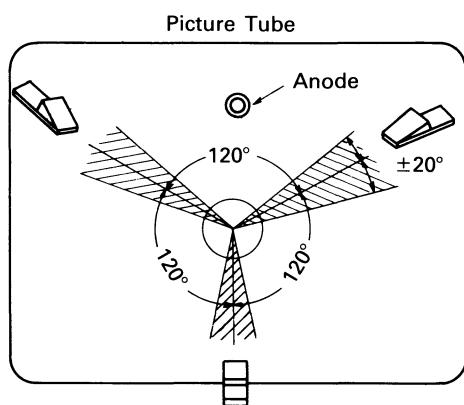

- 4) Push the three rubber wedges between the picture tube cone and the deflection yoke at the positions indicated in Fig. 11.
- 5) Observe the entire screen and make sure convergence adjustment is complete. If necessary, change the positions of the wedges and repeat step 1) and 2) above.
- 6) After the position of the wedges have been decided, gently turn up the end of the wedge and strip the tape from the rear of the end to expose the adhesive material, then adhere to the picture tube cone. (Fig. 12)

**Fig. 10**

**Fig. 12**

**Fig. 11**

**PARTS LIST (AUM-1371A, AUM-1371A(C),  
EUM-1471A, EUM-1471A(B))**

In order to expedite delivery of replacement part orders,

- Specify: 1. Model number  
2. Part number and Description  
3. Quantity

Unless full information is supplied, delay in execution of orders will result.

MODEL : AUM-1371A  
NOTE 1: AUM-1371A(C)

MAIN-PCB

- MODEL : AUM-1371A      AUM-1371A(C)**

**NOTE 1:**

  - The unit of resistance "ohm" no symbol.  
Accordingly,                    K = 1000 ohms  
                                  M = 1000K ohms.
  - The wattage of resistor, if not specifically designated, is 1/4 watt.
  - Resistors, if not specifically designated, are carbon resistors.
  - The marks of resistors are as follows:
 

<b>CE</b>	:	Cemented resistor
<b>MB</b>	:	Metal oxide film resistor (type B)
<b>MPC</b>	:	Metal plate cement resistor.
<b>(S)</b>	:	Fixed composition resistor
<b>(W)</b>	:	Wire wound resistor
<b>(M)</b>	:	Metal film resistor
  - The tolerance of resistor value is:  
Not specified= $\pm 5\%$ , K= $\pm 10\%$  M= $\pm 20\%$
  - The unit of capacitance, if not specifically designated, is:
    - $\mu F$ , for numbers less than 1
    - PF, for numbers more than 1
  - Capacitors, if not specifically designated are Ceramic capacitors except electrolytic capacitors.
  - The marks of capacitors are as follows:
 

<b>ALM</b>	:	Aluminus electrolytic capacitor
<b>MF</b>	:	Polyester capacitor
<b>PP</b>	:	Polypropylene film capacitor
<b>TANT</b>	:	Tantalum capacitor
<b>TF</b>	:	Twin film capacitor.
<b>MF.PP</b>	:	Polyester polypropylene film capacitor.
<b>MPP</b>	:	Metallize plastic film capacitor.
<b>NP</b>	:	Non polarized electrolytic capacitor.
<b>±</b>	:	Electrolytic capacitor
  - The DC working voltage of capacitor, if not specifically designated is: 50V
  - The tolerance of capacitor value, if not specifically design-

**SPECIFIC SYMBOLS**

SPECIFIC SYMBOLS	
	Zener Diode
	Varistor
	Varicap
	Air Gap
	Part (resistor) attached on the copper-foil side of PCB
	Fusible Resistor
	Ceramic filter

- 1.DC voltages were measured from points indicated to the circuit ground with a VTVM.
- 2.This is a basic schematic diagram. Some sets may be subject to modification according to engineering improvement.
3. Reading of measured voltage with transistor and IC voltage described in the UPPER COLUMN SHOWS VIDEO SIGNAL and in the LOWER COLUMN TTL-SIGNAL.(21.8KHZ, EGA).  
Singular voltage indicates the value is equal withVIDEO-SIGNAL and with TTL-SIGNAL.
4. COMPOSITE=VIDEO SIGNAL  
TTL=EGA(21.8KHZ)(16color bar)

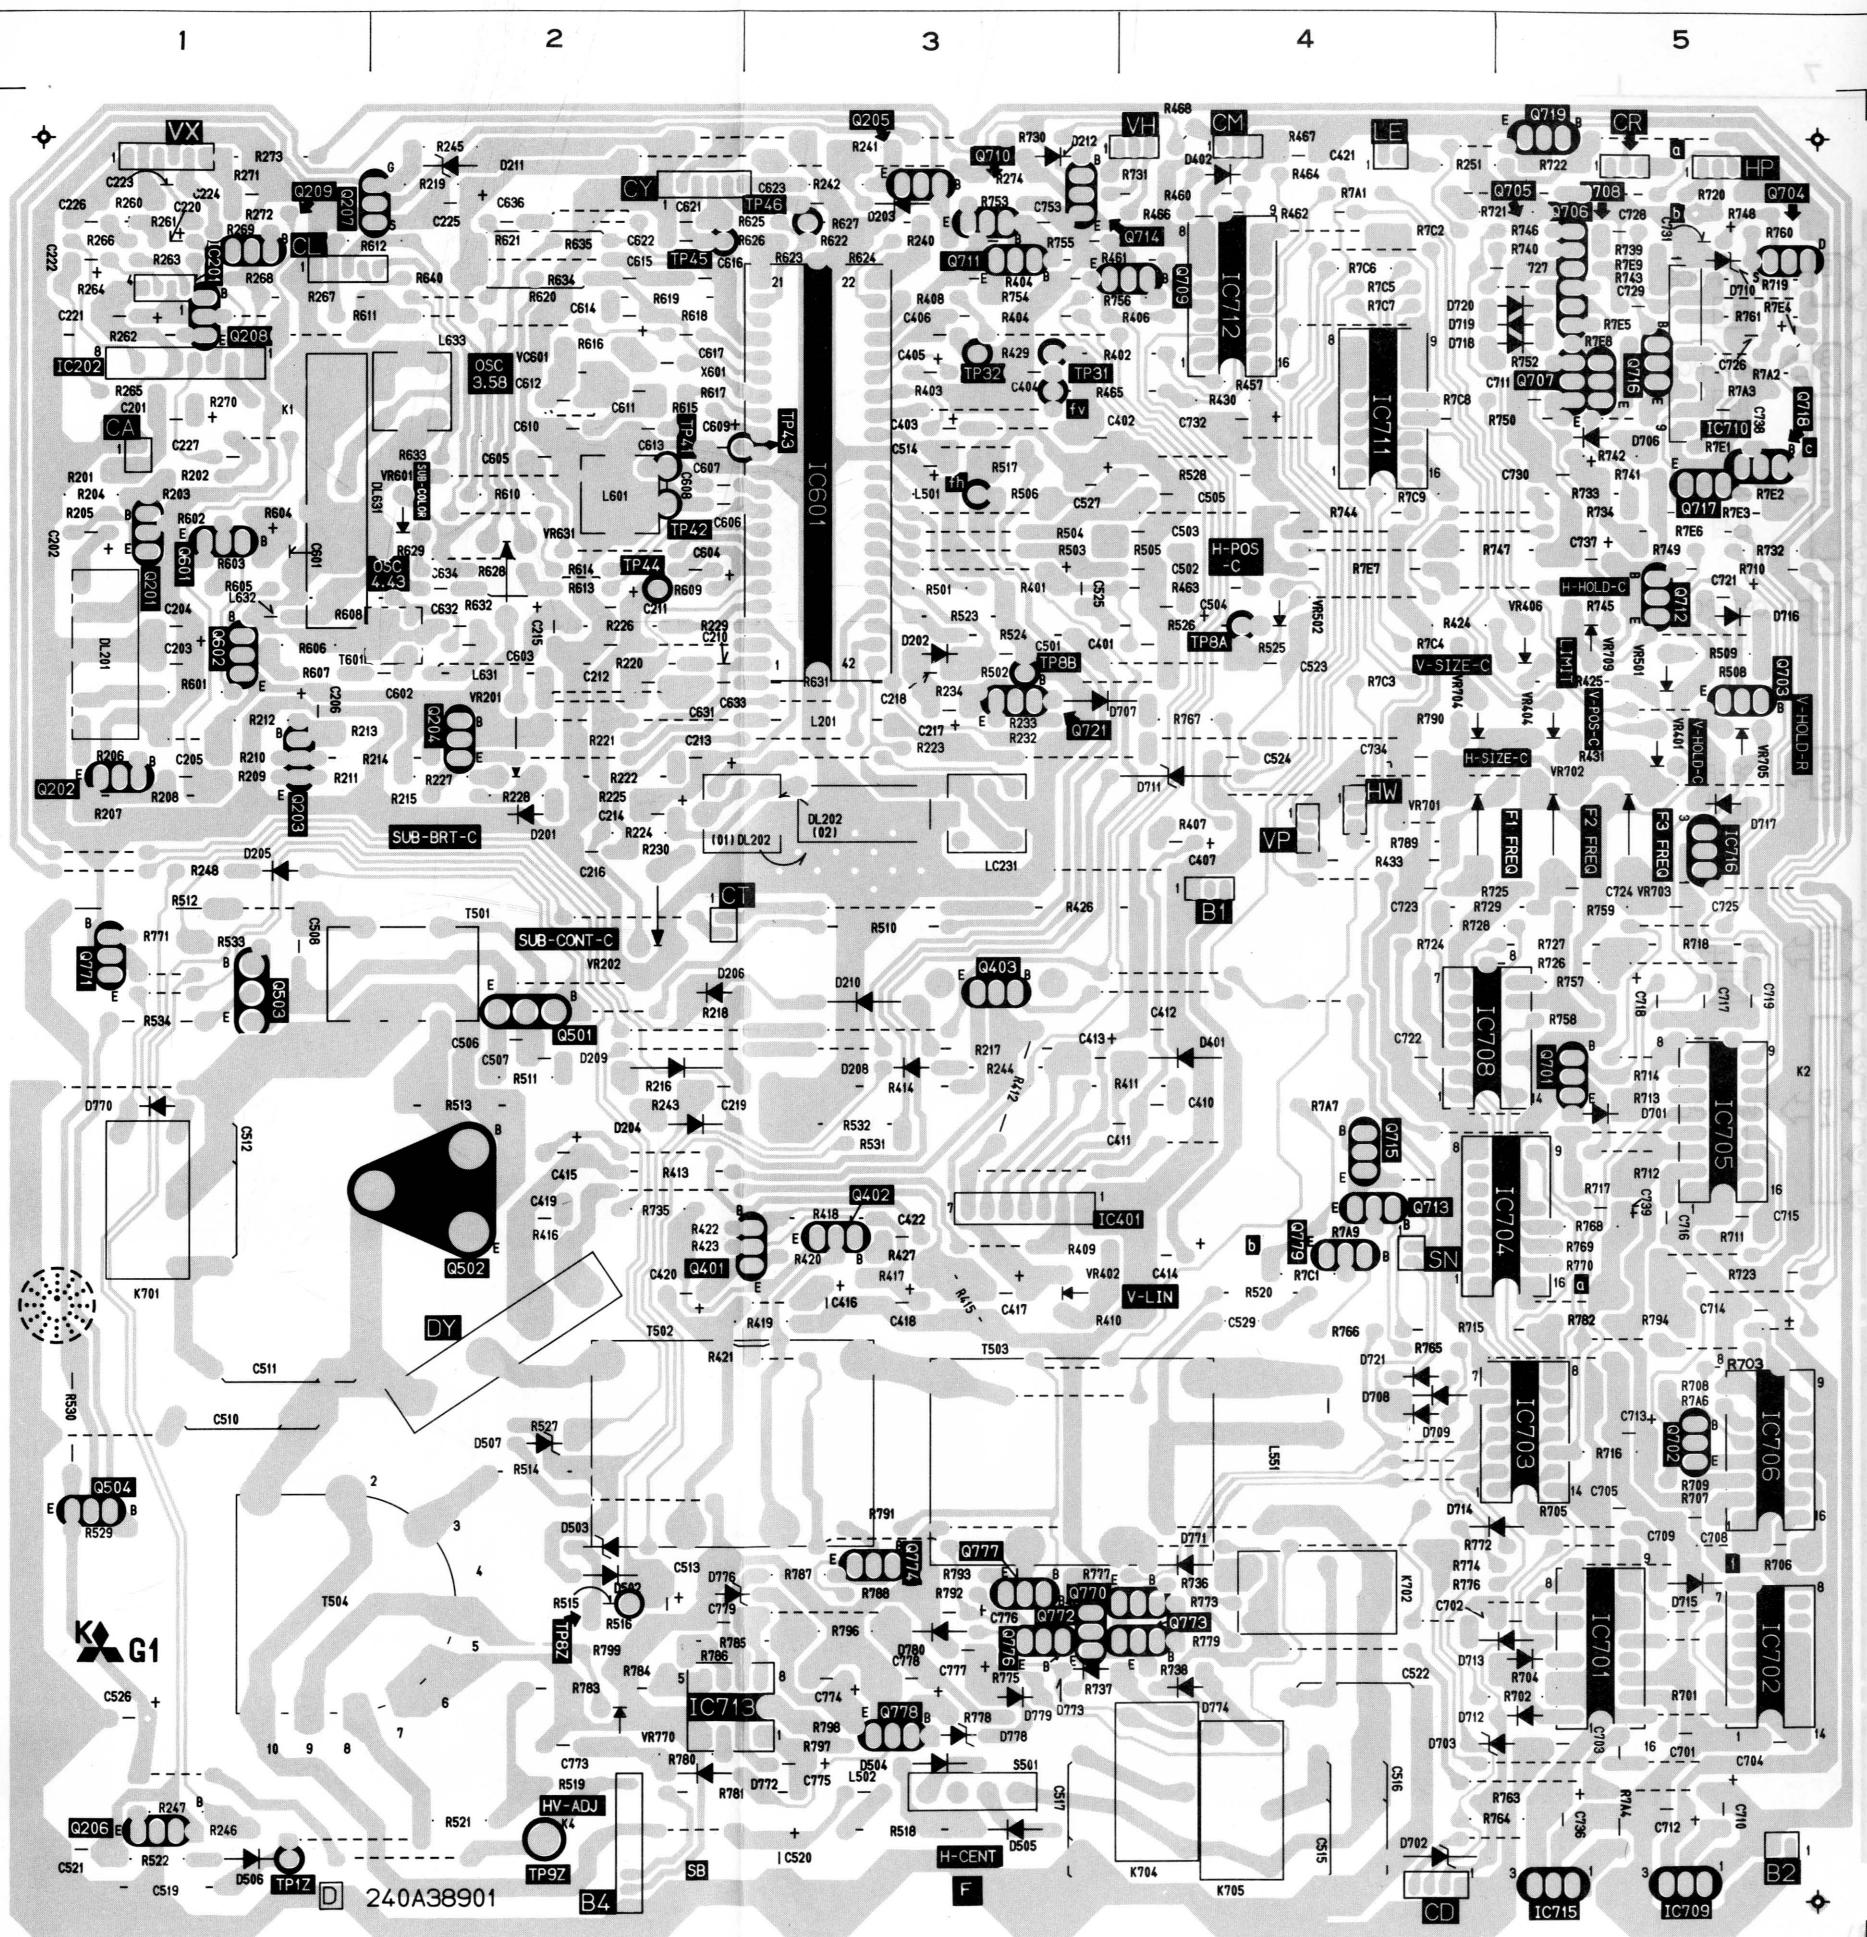

**SHADED COMPONENTS HAVE SPECIAL CHARACTERISTICS IMPORTANT TO SAFETY. BEFORE REPLACING ANY OF THESE COMPONENTS READ CAREFULLY THE PRODUCT SAFETY NOTICE IN THE SERVICE MANUAL. DON'T DEGRADE THE SAFETY OF THE RECEIVERS THROUGH IMPROPER SERVICING.**

SERVICE MAN WARNING  
X-RADIATION PRECAUTION  
THIS PRODUCT INCLUDES CRITICAL ELECTRICAL  
AND MECHANICAL PARTS ESSENTIAL FOR X-RADI-  
ATION PROTECTION.  
TO AVOID POSSIBLE EXPOSURE TO X-RADIATION  
TAKE X-RADIATION PROTECTIVE MEASURES FOR  
PERSONNEL DURING SERVICING.  
SEE SERVICE INSTRUCTIONS FOR SPECIFIED RE-

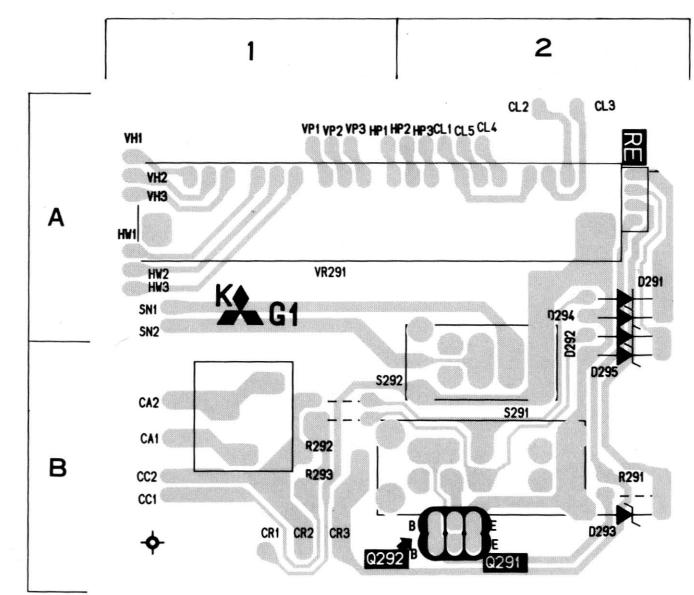

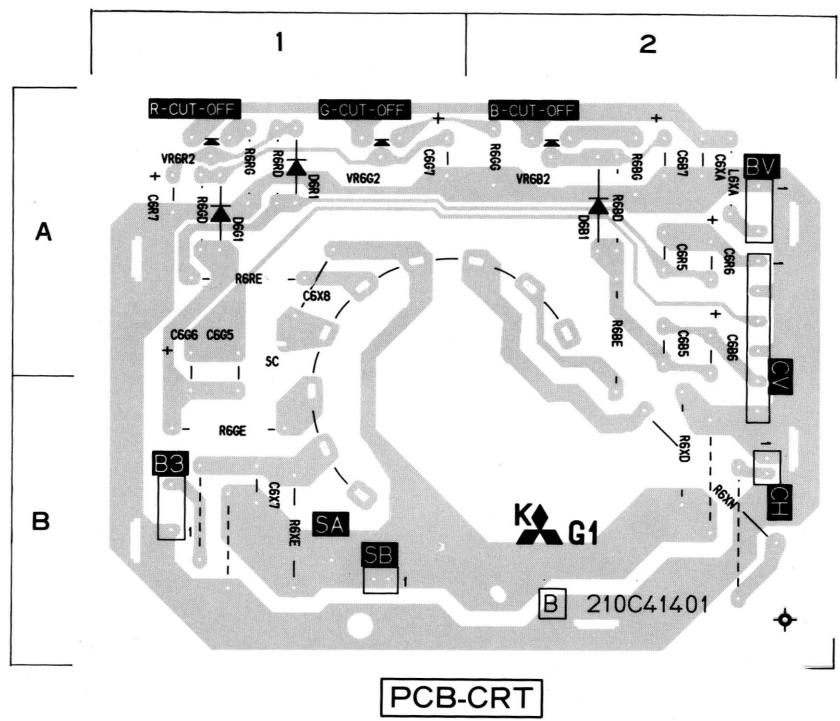

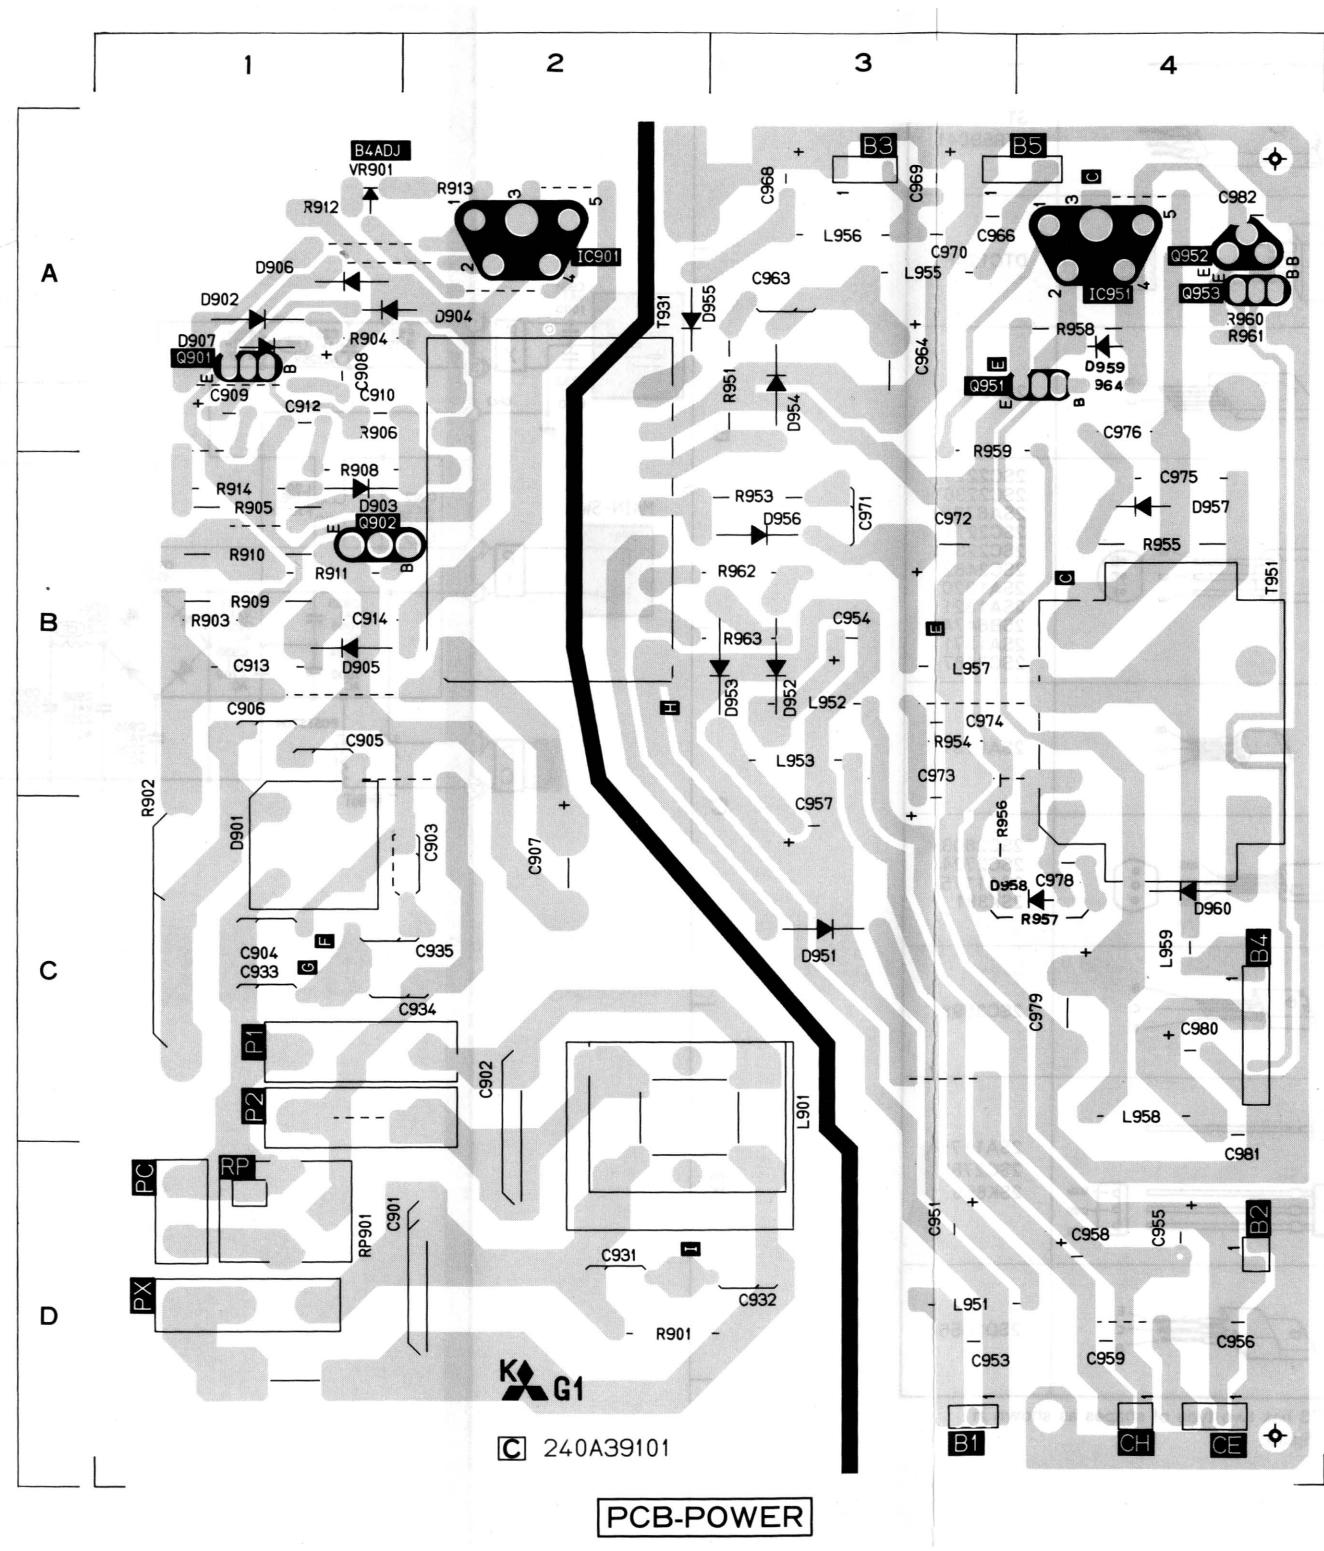

LES ELEMENTS CONSTITUTIFS HACHURES ONT DES CARACTERISTIQUES SPECIALES IMPORTANTES A LA SECURITE. AVANT DE REMPLACER L'UN OU L'AUTRE DE CES ELEMENTS, LIRE ATTENTIVEMENT LA NOTICE DE SECURITE D'APPAREIL DANS LE MANUEL DE SERVICE.

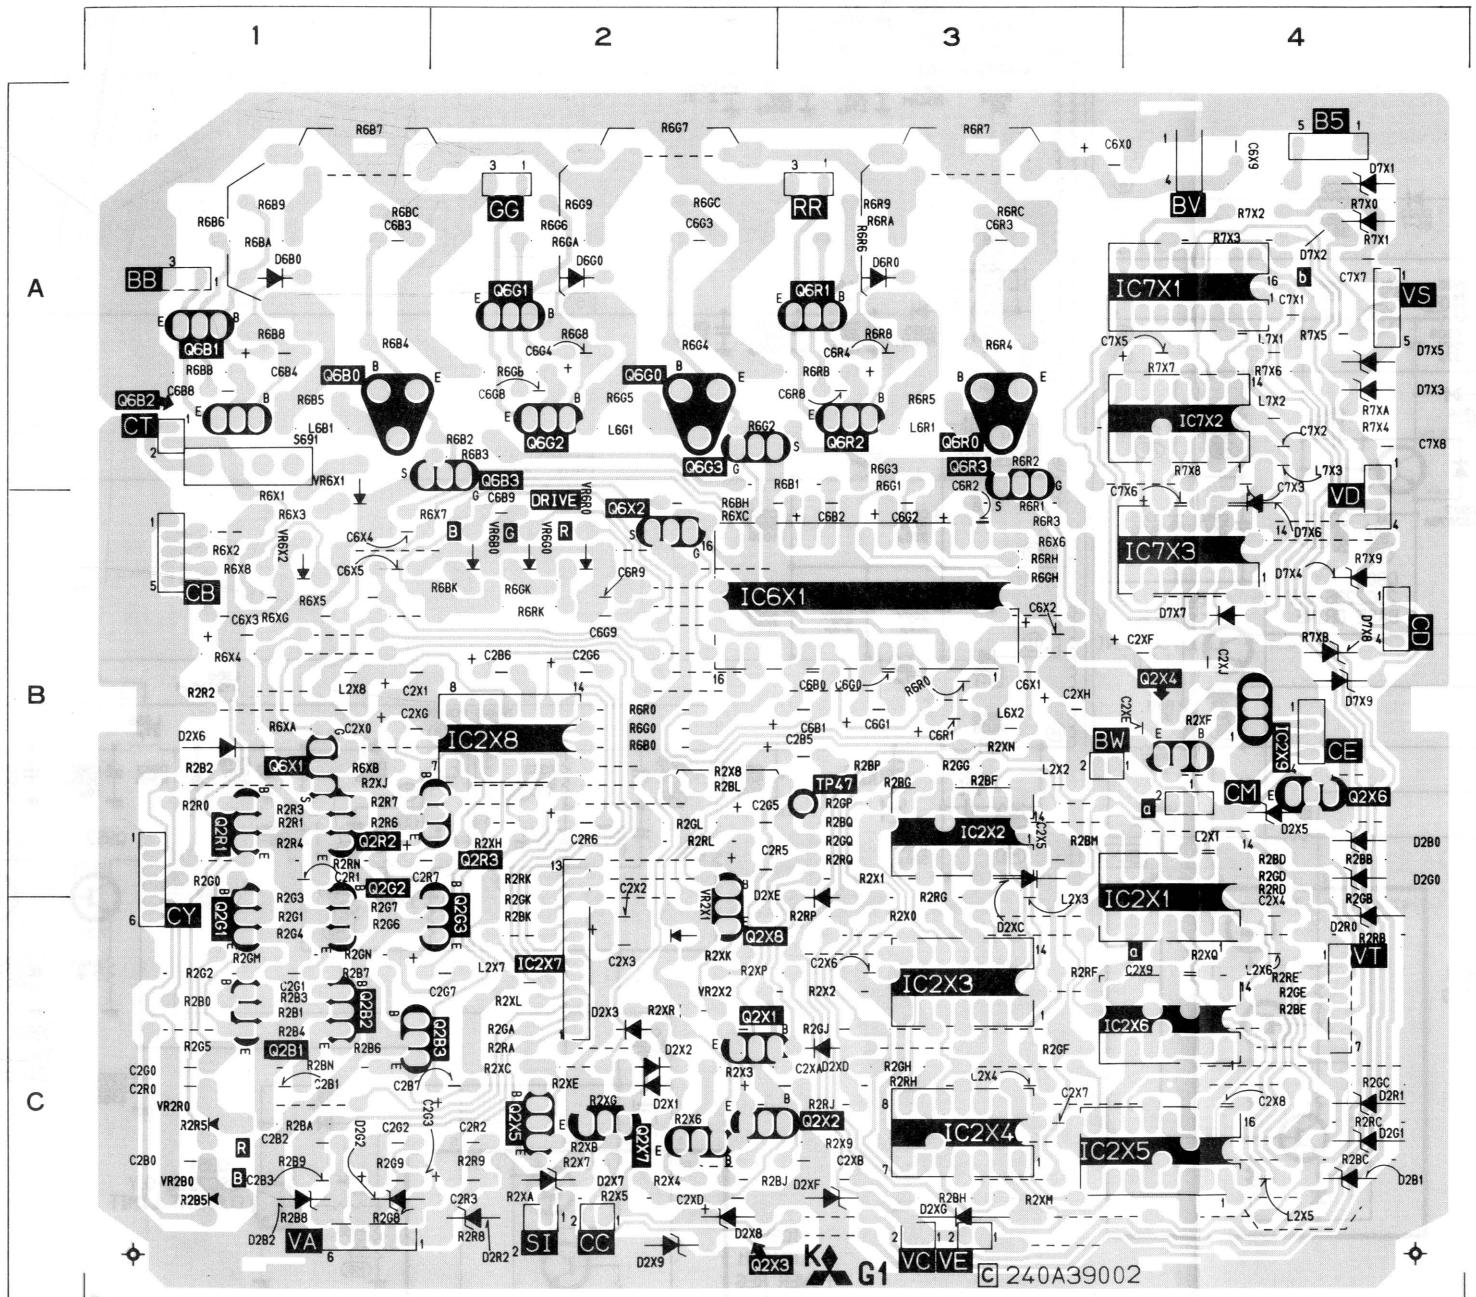

NE PAS NUIRE A LA SECURITE DES RECEPTEURS PAR SERVICE NON APPROPRIE.

AVERTISSEMENT AU DEPANNEUR  
PRECAUTIONS CONTRE LA RADIATION AUX RAYONS  
X LE PRESENT APPAREIL COMPORTE DES PIECES  
IMPORTANTES ELECTROMECANIQUES POUR LA  
PROTECTION CONTRE LA RADIATION AUX RAYONS  
X. POUR EVITER TOUTE EXPOSITION EVENTUELLE  
A LA RADIATION AUX RAYONS X, PRENDRE LES  
MESURES DE PROTECTION AU COURS DU DEPANNAGE.  
VOIR LES INSTRUCTIONS D'ENTRETIEN POUR LES
